Complete Quiz Bank

Interactive exam revision

Week 1–11 | 205 questions | 20 quizzes

Canvas captured 2026-11-09 · 20 visible submissions · 205 attempt records

165 official complete keys verified. 40 questions are Unverified, including 3 with separate lecture-supported inferences.

How to use this PDF

Open a quiz from Contents or the bookmark sidebar. Try a question, select View Answer to inspect its key and Canvas evidence, then select Back to Question to return.

Each quiz uses its highest-scoring visible submission. Practice options follow that submission's order. Answers are identified by quiz number and question number.

Quiz numbers follow the order of the 20 quizzes in Contents.

Matching choices come from the visible review evidence and are listed alphabetically. Canvas did not show the original dropdown order.

Inferred — Not Official identifies lecture-supported interpretations. Official verification relies on option-level or matching evidence published by Canvas.

Stems and options retain their original English. A, B, C and similar labels identify the visible option order for each attempt. Letters already present within option text are retained. Matching labels identify the left-hand items.

Answer Key & Explanations

Week 01 - Weekly Quizzes

Quiz 01 · 14 questions

Q001 · Question 1

View Answer

Human computer interaction is...

A. A discipline concerned with the design and audit of personal computers for human use and with the study of major phenomena surrounding them.

B. A discipline concerned with the design, evaluation and implementation of interactive systems for human use and with the study of major phenomena surrounding them.

C. A discipline concerned with the design and implementation of machines for human use and with the study of phenomena surrounding them.

D. A discipline concerned with the testing and audit of interactive computing systems for human use and with the study of events surrounding them.

Q002 · Question 2

View Answer

Which of the following is NOT an interactive system?

1. Spork
2. Social media websites
3. Mobile applications
4. Game controllers

A. 2, 3 and 4 only.

B. 1 and 4 only.

C. 4 only.

D. 1 only.

Q003 · Question 3

View Answer

Poorly designed interfaces can...

A. improve health

B. incur additional costs

C. improve morale

D. decrease productivity

Q004 · Question 4

View Answer

User experience is:

A. a person's perceptions and responses that result from the use of a product, system or service.

B. the measurement of many people's feelings towards a product.

C. the perceivable action possibilities that an a person understands from an object..

D. the extent to which a product can be used by specified users to achieve specified goals with effectiveness, efficiency and satisfaction.

Q005 · Question 5

View Answer

Which of the following is a usability goal?

A. Effectiveness

B. Boring

C. Fun

D. Utility

Q006 · Question 6

View Answer

Which of the following design principles support learnability?

A. Visibility

B. Conviviality

C. Consistency

D. Affordances

Q007 · Question 7

View Answer

All design rules must be followed in practice.

A. True

B. False

Q008 · Question 8

View Answer

Which of the following is an example of a design standard?

A. Web Content Accessibility Guidelines (WCAG)

B. Visibility

C. ISO9241-11

D. Schneiderman Eight Golden Rules

Q009 · Question 9

View Answer

Match Schneiderman's Eight Golden Rules that are similar to Nielsen 10 Usability Heuristics.

A. Strive for consistency

B. Enable frequent users to use shortcuts.

C. Reduce short-term memory load.

D. Offer simple error handling.

Matching choices · alphabetical

Consistency and standards

Design dialogue to yield closure.

Error prevention

Flexibility and efficiency of use

Recognition rather than recall

Q010 · Question 10

View Answer

Counters and progress bars used to indicate how much of an operation is complete is an example of _____.

A. Affordances

B. Consistency

C. Visibility

D. Feedback

Q011 · Question 11

View Answer

_____ is an interaction pattern aim at duping users to getting them to do things that they did not intend to do.

A. Anti-pattern

B. Design Pattern

C. Dark Pattern

D. Software Pattern

Q012 · Question 12

View Answer

Which of the following statements is TRUE?

A. All design principles must be demonstrated by a single product.

B. There is a secret formula that you can use to design good interfaces.

C. The graying out of buttons to prevent users from proceeding is an example of constraints.

D. It is possible to make ALL interfaces consistent through the use of design standards.

Q013 · Question 13

View Answer

Which of the following statements are true about usability?

1) Usability includes how easy it is for users to learn and use a system effectively

2) Usability focuses on how aesthetically pleasing a product looks

3) Usability is only important during the final stages of product development

A. Usability includes how easy it is for users to learn and use a system effectively
B. Usability is only important during the final stages of product development
C. Usability focuses on how aesthetically pleasing a product looks
D. [Blank Canvas option]

Q014 · Question 14

View Answer

Which of the following are true about user experience:

A) The quality of experience during interaction with a design

B) UX is mainly concerned with backend performance and server uptime

C) A person’s perceptions and responses from using a product

D) User experience only refers to the visual design of a product

E) The speed of the internet connection

A. D, E
B. A, C
C. B, D

Week 02 - Weekly Quizzes [Humans]

Quiz 02 · 12 questions

Q015 · Question 1

View Answer

Which of the following is an example of a cognitive process?

A. Problem-solving
B. Attention
C. Listening
D. Perception

Q016 · Question 2

View Answer

Which Gestalt Laws of perception help to resolve ambiguity and fill in missing data?

A. Continuity
B. Figure/Ground
C. Similarity
D. Proximity

Q017 · Question 3

View Answer

What is Norman's Gulf of execution?

A. Distance between the user's goals and the means of achieving them through the system
B. The amount of effort required to determine the system state
C. One of the first HCI models to be derived from the information processing theory

Q018 · Question 4

View Answer

Which of the following statements are TRUE?

A. Our short term memory is limited.
B. Our attention is limited.
C. Our memory is perfect.
D. Humans are good at multi-tasking.

Q019 · Question 5

View Answer

Which of the following Gestalt Laws of Perception can be used to direct attention?

A. Figure and Ground

B. Proximity

C. Similarity

D. Common Fate

Q020 · Question 6

View Answer

Creating a gap between two distinct groups of objects is...

A. an example of similarity.

B. an example of common fate.

C. an example of continuity.

D. an example of proximity.

Q021 · Question 7

View Answer

Match the following explanation to each term.

A. Iconic memory

B. Echoic memory

C. Autobiographical memory

D. Semantic memory

E. Procedural memory

Matching choices · alphabetical

A person or building that we perceive positively.

Hold information related to meaning

Memories related to personal events

Memories related to sound in caves.

Memories that last forever

Sensory buffer for our auditory perception

Sensory buffer for our vision

Stores knowledge on how to do things

Q022 · Question 8

View Answer

Match examples of needs and motivation to the correct term.

A. Extrinsic motivation

B. Intrinsic motivation

C. Physiological Needs

D. Psychological Needs

E. Self-fulfillment Needs

Matching choices · alphabetical

Curiosity

Food

Public recognition

Q023 · Question 9

View Answer

Which of the following are examples of affective computing?

A. An android with facial expression.

B. Technology that replaces manual labour in the construction site.

C. Systems that recognizes human emotions through speech and visual images.

Q024 · Question 10

View Answer

Which of the following statements are FALSE about human capabilities and limitations?

A. Our vision is optimized to see structure.

B. Recognition is easy; recall is even easier.

C. Our hand-eye coordination follows laws. An example is Hicks Law which dictates reaction time is dependent on the number of options available.

D. You are reading this text using your peripheral vision.

Q025 · Question 11

View Answer

Which statements correctly describe the principle of similarity?

1. A) Symmetric arrangements reduce visual complexity
2. B) Similar colors, shapes, or sizes lead to grouping
3. C) Objects moving in the same direction appear grouped
4. D) We perceive continuous forms rather than disconnected segments
5. E) Objects that look similar are perceptually grouped

A. C) Objects moving in the same direction appear grouped

B. A) Symmetric arrangements reduce visual complexity

C. B) Similar colors, shapes, or sizes lead to grouping

D. E) Objects that look similar are perceptually grouped

E. D) We perceive continuous forms rather than disconnected segments

Q026 · Question 12

View Answer

Which of the following illustrate figure/ground perception?

1. A) The visual field is separated into figure (foreground) and ground (background)
2. B) Pop-up windows focus attention on the figure
3. C) Figure is the object of attention, ground is background
4. D) Objects that are close together are automatically grouped
5. E) Separation of figure and ground helps guide attention

A. C) Figure is the object of attention, ground is background

B. E) Separation of figure and ground helps guide attention

C. D) Objects that are close together are automatically grouped

D. B) Pop-up windows focus attention on the figure

E. A) The visual field is separated into figure (foreground) and ground (background)

Week 2 - In-Class Quiz

Quiz 03 · 4 questions

Q027 · Question 1

View Answer

What is the total percentage of the individual work in INFO3315?

A. 30%
B. 10%
C. 5%
D. 15%

Q028 · Question 2

View Answer

What does the usability goal ‘Memorability’ refer to?

A. Supports users in carrying out the tasks
B. Must be able to do what it is designed to do
C. Learn the system through self-exploration
D. Remember how to use the system once learned

Q029 · Question 3

View Answer

Which of the following is NOT a goal of interaction design in HCI?

A. Safety
B. Effectiveness
C. Utility
D. Affordability

Q030 · Question 4

View Answer

What does the usability goal 'Learnability' refer to?

A. The ability to remember how to use the system
B. The ability to perform tasks safely
C. The ability to learn the system through self-exploration
D. The ability to use the system efficiently

Week 03 - Weekly Quizzes [Interaction Design]

Quiz 04 · 20 questions

Q031 · Question 1

View Answer

The lifecycle model is created at the start of the project and followed strictly during the project.

A. True

B. False

Q032 · Question 2

View Answer

All users are stakeholders.

A. True

B. False

Q033 · Question 3

View Answer

We must follow AgileUX process during the project.

A. True

B. False

Q034 · Question 4

View Answer

PACT analysis must always be done to scope out a design problem.

A. True

B. False

Q035 · Question 5

View Answer

Which of the following are principles of user-centered design? (select all that apply)

A. When problems are found; don't fix these until official complaints are filed when the product is released.

B. Understanding who the users will be by studying their cognitive, behavioral and attitudinal characteristics.

C. Observing, measuring and analyzing the reactions and performance of intended users to prototypes.

Q036 · Question 6

View Answer

Which strategy is mainly critical for understanding the context of use of the design/product?

A. Designing for the average user

B. Conducting surveys without task observation

C. Relying on findings from prior projects

D. Ignoring differences between novice and expert users

E. Observing users in real environments performing tasks

Q037 · Question 7

View Answer

The lifecycle model (or process model) is used to... (select all that apply)

A. showcase your artistic skill in using digital tools.

B. tell each team what they must do and the sequence that it must be done.

C. force everyone to follow the same activities during the project.

D. represent a model that captures a set of activities and how they are related.

Q038 · Question 8

View Answer

Which activities typically occur in the Define phase of the Double Diamond model? (Select all that apply)

A. Synthesizing research insights

B. Brainstorming multiple solutions

C. Mapping user needs

D. Creating a clear problem statement

E. Rapid prototyping

Q039 · Question 9

View Answer

Select ALL the statements that are TRUE.

A. User-centered design helps designer move away from their preferences and focus on the users' needs and goals.

B. You need to be a genius in order to use the Genius Design approach.

C. Users sometimes don't know what they want.

D. User-centered design can result in the development of a wrong product if the wrong set or type of users are chosen.

Q040 · Question 10

View Answer

Usability is about how easily and effectively people can use a product to reach their goals — not just how it looks. Which of the following statements are true about usability? (select all that apply)

A. Usability includes how easy it is for users to learn and use a system effectively.

B. Usability focuses on how aesthetically pleasing a product looks

C. Usability is only important during the final stages of product development.

D. Usability involves evaluating user satisfaction with a product.

E. Usability helps identify and reduce user errors during interaction with a system.

Q041 · Question 11

View Answer

The PACT framework helps designers: (select all that apply)

A. to understand the activities that people want to undertake and the contexts in which those activities take place.

B. understand the people who will use their systems, services and products.

C. to determine the requirements of the system, services or product without direct users involvement.

D. to know about the features of interactive technologies and how to approach designing interactive systems and services that deliver a good UX.

Q042 · Question 12

View Answer

What are the implications of empirical measurement in User-Centred Design? (Select all that apply)

A. Designers rely on their mental models

B. Metrics are only collected after product launch

C. User reactions are measured to validate design assumptions

D. Design decisions are based on user performance data

E. Feedback is gathered through simulations and prototypes

Q043 · Question 13

View Answer

Which of the following correctly describe the gulf of evaluation? (select all that apply)

A. The user cannot tell whether the system has responded to their action

B. The user cannot determine what actions are available to achieve their goal

C. The user performs the correct action but the system fails to execute it

D. The user's goal cannot be mapped onto any available interface action

E. The user cannot interpret whether the system's current state matches their intended goal

Q044 · Question 14

View Answer

It is important to involve users throughout the design and development process because: (select all that apply)

A. we can get feedback from the users perspective.

B. they can see the product's capabilities from an early stage.

C. users who are involved will feel a sense of ownership towards it and support its use.

D. we can demand and receive more resources from management for development.

Q045 · Question 15

View Answer

Which of the following are basic activities of interaction design? (select all that apply)

A. Designing alternatives that meet the requirements.

B. Evaluating the product and the user experience that it offers throughout the process.

C. Prototyping the alternative designs so that they can be communicated and assessed.

D. Discovering requirements for the interactive product.

Q046 · Question 16

View Answer

Why must the problem space be explored and articulated at the start of the project? (select all that apply)

A. To determine possible current user expectations.

B. To understand the context for which it will be used.

C. Marks are awarded for it during the project.

D. To reduce misunderstanding between team members.

E. To determine the purpose of design.

Q047 · Question 17

View Answer

Why is user involvement critical in user-centred design? (Select all that apply)

A. It increases the likelihood of user acceptance

B. It guarantees technical success

C. It helps uncover real user needs and pain points

D. It ensures the product meets business goals

E. It reduces the need for usability testing

Q048 · Question 18

View Answer

Which of the following best reflect the principle of early focus on users and tasks? (Select all that apply)

A. Observing how users perform real-world tasks

B. Prioritizing technical feasibility over user needs

C. Designing based on stakeholder preferences

D. Involving users only during usability testing

E. Understanding user goals and contexts before prototyping

Q049 · Question 19

View Answer

Which statements align with User-Centred Design iteration principles? (Select all that apply)

A. Develop initial prototypes, then refine them using real user feedback

B. Only test the final product with users to save time

C. Treat the first design as final once it has been reviewed internally by the team

D. Use both qualitative and quantitative feedback to inform design

E. Iterate on designs, prioritising high-impact usability issues

Q050 · Question 20

View Answer

Select all the statements that are TRUE about PACT framework. (select all that apply)

A. Printers are a form of output technology as it allows users to produce physical copies of the contents.

B. The type of input technology required by the system is dependent on the type of data and instructions to be provided by the user.

C. Context can be analyzed independent of activity.

D. Designers must also factor in the cost of the user's internet package for T in PACT when considering bandwidth and speed.

E. P in PACT refers to all the contents covered in human information processing model.

Week 3 - In-Class Quiz

Quiz 05 · 4 questions

Q051 · Question 1

View Answer

Which of the following is an advantage of using sound alerts in an interface?

A. Sound reduces the demands on visual attention.

B. Sound has high resolution and can convey detailed information.

C. Users can choose to ignore sound more easily than visual cues.

D. Sound is always preferred over visual information.

Q052 · Question 2

View Answer

Name the advantages of the sound alerts, select as many options as applicable.

A. Sound is annoying

B. Presenting absolute data is difficult

C. Reduces demand on visual attention

D. Sound has low resolution

E. Sound is attention grabbing

Q053 · Question 3

View Answer

The screenshot below demonstrates a logo of the World Wildlife Fund (WWF). This example indicates one of the Gestalt Laws of Perception used in Interaction design. State the most relevant law that describes this.

A. Closure

B. Continuity

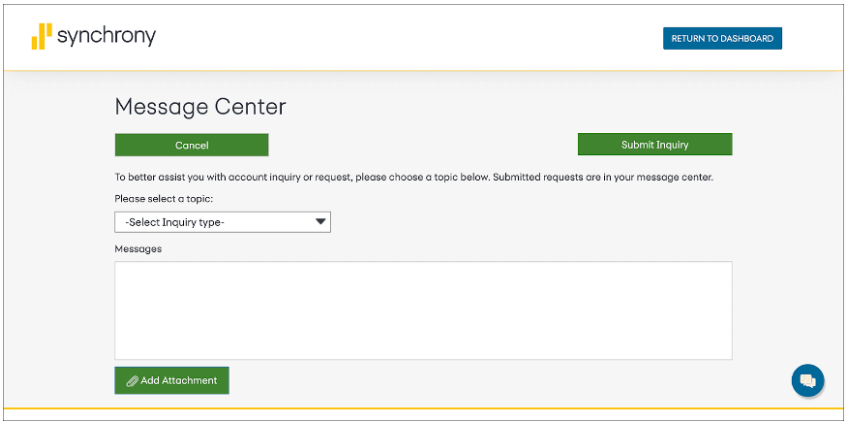

C. Proximity

D. Similarity

Q054 · Question 4

View Answer

The screenshot below demonstrates a popup window that the user needs to respond. The window contains green rectangular buttons. This example indicates one of the Gestalt Laws of Perception used in Interaction design. State the most relevant law that describes this.

A. Continuity

B. Closure

C. Proximity

D. Similarity

Week 04 - Weekly Quizzes [Data Gathering and Requirements]

Quiz 06 · 17 questions

Q055 · Question 1

View Answer

Which of the following statements are TRUE?

A. Sales and marketing is responsible for setting the requirements.

B. We may not be the end users of the product we design.

C. We can forgo doing user research because our team has no time to perform such studies.

D. Users cannot articulate what they want so it is pointless to ask them for their opinion.

Q056 · Question 2

View Answer

Which of the following statements are FALSE?

A. The 'could haves' in Moscow rule are the next important requirements after 'must haves'.

B. The 'would have' is of the utmost priority.

C. The 'must have' is of the utmost priority.

D. The 'would haves' in Moscow rule is what the team should deliver once they are complete with the other requirements.

Q057 · Question 3

View Answer

Which of the following statements about 'Interviews' are correct?

A. Part of the preparation of the note-taker is to understand the interview guide and know the important terms of the domain.

B. Non-verbal communications should be avoided as it may confuse the note-taker.

C. The interviewer should prepare all questions to be asked in the interview upfront.

D. During the interview, the interviewer should be polite and carefully steer the conversation.

Q058 · Question 4

View Answer

Which of the following statements are wrong about 'Observations'?

A. It is important to know the distinction between open-ended and close-ended questions.

B. The observer has no bias.

C. Observing two people at work is called think aloud.

D. Beware of the note-taker's observation bias.

Q059 · Question 5

View Answer

Which of the following statements about 'Surveys' are correct?

A. In non-probabilistic sampling, it is important to collect demographic data about the respondents.

B. It must be deployed using a survey tool.

C. It can be self-administer and done remotely.

D. It provides deep and rich data about the participants.

Q060 · Question 6

View Answer

Which of the following is an example of close-ended ordered response?

A. Likert scale

B. Rank order

C. Multiple choice selections

D. Binary response

Q061 · Question 7

View Answer

You have made an appointment to interview a dietitian to learn more about healthy eating and diet recommendations for diabetic patients. Which of the following are appropriate data recording approaches that can be used during the session?

A. Key-stroke logging

B. Diaries

C. Eye-tracking

D. Audio recording

Q062 · Question 8

View Answer

These are the requirements that you have noted down for the healthy eating and diet recommendations application targeted for diabetic patients. Match the requirements.

A. The application must calculate the total amount of calories consumed by the patient at each meal.

B. Images of the user's current meal must be stored with its timestamp to track the user's last meal.

C. Users will always eat their meals at venues with sufficient lighting to view their food.

D. Permission of use must be given by the legal guardian for users below the age of 11.

E. The application must make the users feel guilty when their current meal is unbalance.

Matching choices · alphabetical

Data requirements

Environment requirements

Functional requirements

Usability requirements

User experience requirements

User requirements

Q063 · Question 9

View Answer

Which of the following should NOT be done when you are planning a data gathering session?

A. Prepare documents to inform participants of their rights and how data will be collected during the session.

B. Run pilot studies to test the tools and procedures before the actual session.

C. Perform pilot studies to validate results after the actual session.

D. Identify the purpose of the data gathering session.

Q064 · Question 10

View Answer

An obstetrician have requested the development of a mobile application for expectant mothers with pregnancy complications to keep track of their's and their child's health status during pregnancy. He has a requested that the application has a report function that allows his patients to send him a consolidated report before their check-up session. He has given samples of the type of reports and information that he expects from his clients.

To elicit requirements for the mobile application, you have shadowed (with permission) the obstetrician for a day. Which of the following statements is most likely correct?

A. The approach makes sense because you can understand what the obstetrician does during a check-up.

B. The approach makes sense because the obstetrician will be using the information that is reported by the mobile application.

C. The approach makes no sense because shadowing is not a requirements elicitation technique.

D. The approach makes no sense because the end users of the mobile application is not the obstetrician.

Q065 · Question 11

View Answer

An obstetrician have requested the development of a mobile application for expectant mothers with pregnancy complications to keep track of their's and their child's health status during pregnancy. He has a requested that the application has a report function that allows his patients to send him a consolidated report before their check-up session. He has given samples of the type of reports and information that he expects from his clients.

Which of the following describes the functional requirement of the application?

A. The application should allow users to record the number of fetal movement felt in an hour at a specified time and day.

B. The application will be used at the obstetrician office.

C. The user will be female between the ages of 16 to 50 and has experience using mobile applications.

D. The application must be executable on Android 5 and above.

Q066 · Question 12

View Answer

Which two aspects are the most important to take into consideration in the choice of data gathering technique to elicit requirements for a new e-learning platform?

A. Age of the stakeholders

B. Project deadlines and budget

C. Tools available

D. Availability of stakeholders

Q067 · Question 13

View Answer

What are the two key advantages of using questionnaires for requirements gathering?

A. Questionnaires allow the participants' understanding to be validated.

B. Statistically relevant statements on requirements can be made.

C. A high number of participants is possible.

D. Questionnaires allow participants to be anonymous.

Q068 · Question 14

View Answer

Contextual inquiry is a combination of:

A. Observation

B. Interview

C. Survey

D. Studying documentation

Q069 · Question 15

View Answer

A UX team is considering whether to use contextual inquiry as their primary research method for several upcoming projects. They want to choose methods that are appropriate to the nature of the task, users' cognitive demands, and practical constraints.
In which of the following situations is contextual inquiry unlikely to be useful in its full form, according to established principles? Select all that apply.

A. Understanding how experienced accountants reason about complex tax regulations when resolving unusual cases.

B. Improving the layout of an e-commerce product page, where the primary goal is to optimise visual hierarchy and calls to action.

C. Studying how doctors make rapid diagnostic decisions during emergency procedures, when they cannot be interrupted.

D. Observing air-traffic controllers during live operations, where interruptions could compromise safety and performance.

E. Redesigning a newsletter sign-up form to reduce drop-off, where the interaction consists of a small number of simple fields.

Q070 · Question 16

View Answer

Which of the following are cited as key advantages of using standard questionnaires over creating your own in usability studies?
Select all that apply.

A. They allow completely open-ended responses from participants

B. They are inexpensive to administer

C. They automatically diagnose specific usability problems

D. They have established reliability and validity

E. Their scores can be compared across studies and interfaces

Q071 · Question 17

View Answer

A usability study evaluates a new online course-registration system intended for all undergraduate students at a large university. The study recruits 12 participants with the following characteristics:

- all are computer science students
- all are aged 18–22
- 10 are male, 2 are female
- all report high computer literacy
- most express strong interest in technology and volunteered quickly

The study reports that: "The system is intuitive, fast to learn, and causes little confusion." Which of the following statements are valid concerns or correct interpretations regarding participant recruitment and the conclusions that can be drawn? Select all that apply.

A. The sample may not be representative because experience and computer literacy are higher than in the intended user population.

B. The conclusions are invalid, because usability studies require participants to match the user population exactly in age and gender.

C. Because the system is intended for undergraduates, recruiting only students aged 18–22 is sufficient to generalise findings.

D. The limited diversity of the participant group constrains the conclusions primarily to tech-savvy users, rather than the full user population.

E. Recruiting participants with strong interest and motivation may bias results toward more positive usability outcomes.

Week 4 - In-Class Quiz

Quiz 07 · 4 questions

Q072 · Question 1

View Answer

In the PACT framework, why is it important to consider the "Activities" users are involved in?

A. It ensures that the physical environment is suitable for interaction

B. It helps in designing technologies that meet user expectations

C. It defines the social context of the interaction

D. It identifies the emotions users feel during interaction

Q073 · Question 2

View Answer

Why is understanding the "People" component important in the PACT framework?

A. It defines the context in which the interaction takes place

B. It determines the types of technologies that can be used in a system

C. It provides insights into the users' characteristics, needs, and abilities

D. It helps in designing tasks that are easy for users to complete

Q074 · Question 3

View Answer

What is not an approach to Interaction Design

A. Activity-centred design.

B. User-centred design.

C. Requirements design.

D. Genius design.

Q075 · Question 4

View Answer

In the context of the PACT framework, how does "Context" influence design decisions?

A. It shapes the activities users are likely to engage in

B. It determines the colour scheme of the user interface

C. It dictates the types of people who can use the system

D. It affects how technology is integrated and used in various environments

Week 05 - Weekly Quizzes [Data Analysis]

Quiz 08 · 19 questions

Q076 · Question 1

View Answer

User stories in scenario-based design approach are created from the imagination of team members.

A. True

B. False

Q077 · Question 2

View Answer

Which of the following statements are TRUE?

A. Interviews can be used almost in any stage of the project

B. It is ok to pre-empt an answer when asking questions during the interview

C. Unstructured interviews have a set of defined questions

Q078 · Question 3

View Answer

Which HCI method does this scenario best illustrate? A researcher sits with a user while they perform a task on a new web application and asks detailed questions about why they make certain choices, what difficulties they face, and what they expect the system to do next.

A. Observation

B. Contextual Inquiry

C. Ethnography

D. Interview

Q079 · Question 4

View Answer

Which of the following is TRUE about the affinity diagram?

A. Put all data into one post-it note to save the trees.

B. We cannot discard any of the cards during sorting.

C. We must crowd around a whiteboard to create an affinity diagram.

D. Can be used to organize language data into themes.

Q080 · Question 5

View Answer

Which HCI method does this scenario best illustrate? A UX researcher records the interactions of users performing a set of tasks on a mobile app without interrupting them. The goal is to see how long tasks take, where users hesitate, and which features are used most.

A. Contextual Inquiry

B. Observation

C. Ethnography

D. Survey

E. Interview

Q081 · Question 6

View Answer

Which of the following statements are TRUE about personas?

A. Can be used to inform design decisions

B. They are real living people.

C. Can be used to replace real users during testing.

D. They are created from data collected from actual people.

Q082 · Question 7

View Answer

Contextual inquiry is a combination of interview and observation, built on four principles: Context, Partnership, Interpretation and Focus. Each correct option traces back to one of them. What are the advantages of contextual inquiry? (Select all that apply)

A. Captures context-specific behaviors and decisions

B. Helps uncover unarticulated user needs

C. Reveals real-world workflows and pain points

D. Provides rich qualitative data for design insights

E. Allows for large-scale statistical analysis

Q083 · Question 8

View Answer

What do actors mean in a use-case diagram?

A. Person

B. User

C. Internal system

D. Function

Q084 · Question 9

View Answer

A UX team is considering whether to use contextual inquiry as their primary research method. In which of the following situations is contextual inquiry unlikely to be useful in its full form? (Select all that apply)

A. Understanding how experienced accountants reason about complex tax regulations when resolving unusual cases

B. Studying how doctors make rapid diagnostic decisions during emergency procedures, when they cannot be interrupted

C. Improving the layout of an e-commerce product page, where the primary goal is to optimise visual hierarchy and calls to action

D. Redesigning a newsletter sign-up form to reduce drop-off, where the interaction consists of a small number of simple fields

E. Observing air-traffic controllers during live operations, where interruptions could compromise safety and performance

Q085 · Question 10

View Answer

Which of the following are benefits of using personas over broader user class descriptions? (Select all that apply)

A. Personas guarantee that the final product will be usable by all members of the user population

B. Personas make it easier to argue whether a given feature should be included by testing it against a named individual

C. Personas prevent designers from unconsciously designing for themselves by anchoring decisions to someone specific

D. Personas give the whole organisation a shared, concrete reference for who they are designing for

E. Personas eliminate the need for any other user research methods such as interviews or contextual inquiry

Q086 · Question 11

View Answer

Which of the following features can be used to describe a data?

A. Standard deviation

B. Mean

C. One-way ANOVA

D. Mode

Q087 · Question 12

View Answer

Which of the following are practical considerations when planning an observation? (Select all that apply)

A. Ensuring data is recorded accurately and unobtrusively

B. Choosing between overt and covert observation

C. The observer's presence may influence participant behavior

D. Only observing in laboratory settings

E. Deciding on the duration and timing of observation sessions

Q088 · Question 13

View Answer

A design team has created three personas for an e-textbook interface. Persona A is a 45-year-old nurse returning to study who uses a tablet at night after shifts. Persona B is a 22-year-old full-time student, highly tech-literate, using multiple devices. Persona C is a 60-year-old who has never used an e-textbook and finds touchscreens uncomfortable. Which of the following statements about the use of these personas are correct? (Select all that apply)

A. Personas are useful during design reviews because they give the team a concrete user perspective to adopt when asking "would this user know what to do next?"

B. Since Persona C has the least digital experience, the team should design exclusively for her needs; a design that works for the least experienced user will automatically satisfy all other personas

C. Persona B's high tech-literacy means she is the most reliable proxy for all users, and pilot testing with her would be sufficient to identify usability problems for the full user population

D. Personas derived from real user research data are more grounded and useful than personas invented without data, because they reflect actual user behaviour and context rather than designer assumptions

E. A single design solution is unlikely to meet the needs of all three personas equally well, and the team should explicitly consider which persona is primary when making design trade-offs

Q089 · Question 14

View Answer

What are common disadvantages of observational methods? (Select all that apply)

A. Observer bias may affect data interpretation

B. Limited ability to understand participant motivations

C. Time-consuming and resource-intensive

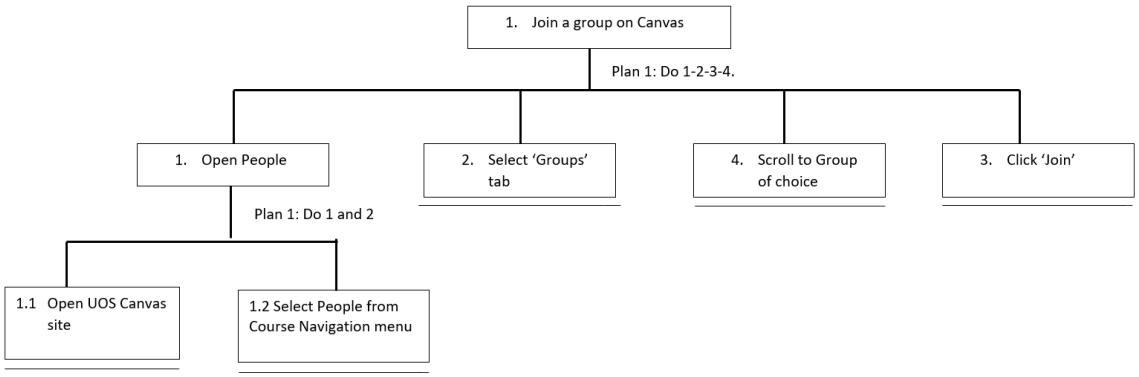

D. Participants may alter behavior if they know they are being observed

E. Guaranteed objectivity in findings

Q090 · Question 15

View Answer

The figure below shows a HTA for the task of 'Joining a group on Canvas'. Which of the following statements are TRUE?

A. "Join a group on Canvas" should be set as Task 0.

B. Sub-task "Scroll to Group of choice" and "Click 'Join' "should be set to Task 3 and Task 4 respectively.

C. To perform sub-task 1, plan 1 should be do 1.1 then 1.2

D. We should remove all the horizontal lines below the boxes.

Q091 · Question 16

View Answer

Which of the following statements correctly describe a persona in user experience design? (Select all that apply)

A. A persona is a fictional character representing a user type based on research

B. A persona is created only for marketing purposes

C. A persona helps designers empathize with users and guide design decisions

D. A persona includes demographic details, goals, and behaviors

E. A persona is a real person interviewed during user research

Q092 · Question 17

View Answer

Which of the following contents should be included in a persona?

A. Identity

B. Setting

C. Skill set

D. Sequence of Events

Q093 · Question 18

View Answer

Which of the following statements correctly describe the strategic purpose of using a primary persona in UX design? (Select all that apply)

A. Designing for a primary persona liberates the team from covering every possible user need, allowing focused, high-satisfaction outcomes for a real subgroup

B. The primary persona should be chosen by averaging characteristics across all candidate personas to maximise inclusivity

C. Personas help end feature debates by anchoring decisions to a specific individual rather than hypothetical users

D. A design made specifically for the primary persona should work satisfactorily for all selected personas, even if not optimally

E. The primary persona should be chosen because their needs represent the edge cases of the user population

Q094 · Question 19

Q095 · Question 1

View Answer

Which of the following is a key principle of contextual inquiry?

A. Designing a product that factors in lifestyle.

B. Organizing focus groups with multiple stakeholders.

C. Allowing for synchronous and asynchronous collaboration.

D. Context: Going to the user, wherever they are, and seeing what they do as they do it

Q096 · Question 2

View Answer

Why are usability requirements critical in system development?

A. They ensure that the system is user - friendly and meets user expectations for ease of use.

B. They determine the system's ability to handle large volumes of data.

C. They help in defining the hardware and software environment for the system.

D. They ensure the system is protected against unauthorized access.

Q097 · Question 3

View Answer

Which data gathering technique combines both interviews and observations?

A. Surveys.

B. Contextual inquiry.

C. Focus groups.

D. Ethnography.

Q098 · Question 4

View Answer

What is the primary focus of usability requirements in system development?

A. Specifying the system's security protocols.

B. Ensuring the system's performance meets technical benchmarks.

C. Defining how easy and efficient it is for users to interact with the system.

D. Outlining the system's operational environment.

Week 06-07 - Weekly Quizzes [Design and Prototyping]

Quiz 10 · 15 questions

Q099 · Question 1

View Answer

Which of the following statements are FALSE?

A. Aesthetics should be prioritised during prototyping.

B. We must always use a prototyping tool to create prototypes.

C. Prototyping is all about making compromises.

D. Sketching is quick way to communicate ideas.

Q100 · Question 2

View Answer

Select ALL statements about mental models that are TRUE.

A. All users will have the same mental model when they look at the system.

B. If the user's mental model of the system is correct, the user will know how to use the system.

C. Systems cannot be built without a clear mental model upfront..

D. The designer's mental model is called conceptual model.

Q101 · Question 3

View Answer

Which of the following is TRUE about interface metaphors?

A. 'Surfing the web' is a metaphor to conceptualize what we do on the web.

B. We must always use interface metaphors in our design.

C. Metaphors must be carefully designed to avoid confusion.

Q102 · Question 4

View Answer

Interaction types are the ways a person interacts with a product. Match each interaction type with respect to the user's action with the system.

A. Responding

B. Instructing

C. Conversing

D. Exploring

E. Manipulating

Matching choices · alphabetical

User receives information from the system and chooses whether to respond.

User tells system what to do.

Users have a dialog with a system.

Users interact with objects in a virtual or physical space.

Users move through a virtual environment or a physical space.

Q103 · Question 5

View Answer

Which of the following statements are FALSE about interface types and interaction types.

A. Both concepts are closely related but different.

B. New interface types will emerge and existing interface types may become obsolete.

C. They are both referring to the same thing.

D. We must always use menus and buttons for instructing.

Q104 · Question 6

View Answer

Which of the following statements are TRUE about selecting appropriate interface types for an application?

A. It is affected by the application's requirements.

B. You must stick with what you know will work.

C. It must be determined by the users.

D. It depends on the environment of use.

Q105 · Question 7

View Answer

Select the most appropriate envisionment technique that you can use in the following situations:

A. Describe the user actions in using the envisioned product and its surrounding context.

B. User's view of the screen when he launches the application for the first time.

C. A tangible representation that the participant can use during a usability test session.

Matching choices · alphabetical

Balsamiq

Figma

Persona

Prototype

Storyboard

Wireframe

Q106 · Question 8

View Answer

Which of the following statements is FALSE?

A. Sketching is a good communication tool during brainstorming.

B. You need to spend a few days sketching to increase the chances of your colleagues listening to your ideas.

C. You must use high grade writing utensils to create sketches.

Q107 · Question 9

View Answer

Which of the following statements best describes the Wizard of Oz technique?

A. The person who invented the technique lived in Oz.

B. The user is under the impression that he is interacting with the actual system but the outputs seen by the user is generated by another person.

C. Wizard is the name of the prototype.

D. It is most useful to convince investors that the system is working and ready for production.

Q108 · Question 10

View Answer

Which of the following statements are TRUE about video prototypes?

A. It can be used to bring wireframe sketches to life.

B. You must have experience in photography and cinematography to create them.

C. It is interactive.

D. Demonstrates dynamically and visually what the interaction looks like.

Q109 · Question 11

View Answer

Which of the following are examples of low fidelity prototypes?

A. Sketches

B. Paper prototypes

C. Functional prototype created in Figma

Q110 · Question 12

View Answer

Which of the following statements are TRUE about Wireframes?

A. Sequence of actions or events the user and the product go through to achieve goal

B. Must be provided by the client.

C. Outlines structure and layout of the page

D. View of a single screen or interaction page

Q111 · Question 13

View Answer

Which of the following statements about the differences between lo-fi and hi-fi prototypes are accurate according to the course materials?

A. Hi-fi prototypes can cause stakeholders to mistakenly believe the product is more complete than it is.

B. Lo-fi prototypes must be well-made; sketches are not sufficient for users to understand the concept.

C. Hi-fi prototypes allow users to explore system functionality more independently, without requiring a guided narrative from the evaluator.

D. Users evaluatinUsers evaluating hi-fi prototypes sometimes focus disproportionately on superficial visual details rather than core usability issues.

E. Lo-fi prototypes are generally better than hi-fi prototypes for evaluating fine-grained interaction design details.

Q112 · Question 14

View Answer

A product team is deciding between a cognitive walkthrough and a think-aloud study for an early lo-fi prototype. Which statements accurately characterise when a cognitive walkthrough is the more appropriate choice?

A. The prototype is at an early stage where the designer is still willing to make structural changes.

B. The team wants to capture a rich record of genuine reactions to the interface.

C. The primary concern is learnability—whether new users can figure out the interface without training.

D. The team needs findings quickly and cannot yet recruit and schedule users.

E. The team wants to measure task completion time and efficiency for expert users.

Q113 · Question 15

View Answer

A user's mental model of a digital library search system is that it works like a Google search: typing any natural-language phrase will return the most relevant results ranked by relevance. The actual system requires Boolean operators and exact field matching to return useful results. Which of the following statements correctly describe this situation and its implications?

A. This kind of mismatch is irrelevant to interface design; it is the user's responsibility to learn how the system actually works before using it.

B. Affordances play a role here: if the search box looks identical to a Google search bar with no indication of required syntax, it affords natural-language search and actively misleads users about the system's behaviour.

C. A think-aloud study would be well suited to revealing this mismatch, because users would verbalise their expectations and confusion as they interact with the search interface.

D. Heuristic evaluation could identify this as a violation of the heuristic "Match between system and the real world," because the system uses conventions that do not match users' existing knowledge and expectations.

E. The mismatch between the user's mental model and the system's actual behaviour is a usability problem, because the user's expectations will lead to strategies that produce poor results.

Week 6 - In-Class Quiz

Quiz 11 · 4 questions

Q114 · Question 1

View Answer

What type of data is typically collected through questionnaires?

A. Observational data, such as recorded behaviours and interactions
B. Quantitative data, such as numerical responses and ratings
C. Experimental data, such as measurements from controlled conditions
D. Qualitative data, such as detailed narratives and personal stories

Q115 · Question 2

View Answer

Which of the following is a qualitative data type?

A. Yearly sales data
B. Words and images
C. Numbers and percentages
D. Time taken to complete a task

Q116 · Question 3

View Answer

Which of the following is a common method for ensuring the reliability of questionnaire data?

A. Using pre-tested and validated questions with clear response options
B. Randomly selecting participants from a large population
C. Observing participants in their natural settings
D. Conducting interviews to supplement the questionnaire data

Q117 · Question 4

View Answer

Which of the following is a common step in performing a Hierarchical Task Analysis (HTA)?

A. Conducting interviews to gather user feedback
B. Creating an affinity diagram to group similar tasks
C. Identifying the overall goal of the task and decomposing it into smaller, manageable subtasks
D. Using statistical methods to evaluate task completion times

Q122 · Question 1

View Answer

Select all evaluation techniques that requires users involvement.

A. In-the-wild studies

B. Fitts Law

C. Heuristic Evaluation

D. Lab studies

Q123 · Question 2

View Answer

Name the method that does not need user involvement for evaluation

A. Cognitive Walkthrough

B. Lab studies

C. In-the-wild studies

Q124 · Question 3

View Answer

Which of the following statements are TRUE about heuristic evaluation?

A. It can be conducted alone.

B. You only need to note down principles that are violated.

C. It can be used at early stages of design.

D. Involves expert users

Q125 · Question 4

View Answer

What can we evaluate in HCI?

A. Conceptual model

B. Final product

C. Weather conditions

D. Early and subsequent prototypes of the system

Q126 · Question 5

View Answer

What are the benefits of running studies in naturalistic settings?

A. Easy to arrange and run

B. Less time consuming compared to lab studies

C. Easy to control

D. Situation and behaviour are more natural

Q127 · Question 6

View Answer

Which of the following factors must be considered when you are determining the total number of participants required for a usability test?

A. Test until there are no new insights

B. Budget

C. Test as many people as we can

D. Time

Q128 · Question 7

View Answer

Which of the following statements are TRUE about usability tests?

A. We must always collect eye movement data, audio and visuals during the test.

B. The participant is given tasks to complete using the prototype.

C. The participant should be allowed to stop when he wants to.

D. Usability tests represent a natural situation

Q129 · Question 8

View Answer

It's good to have a combination of with and without participants methods when running evaluations

A. True

B. False

Q130 · Question 9

View Answer

Which of the following documents must you provide to the participant before a usability test?

A. Participant Consent Form

B. Pre-questionnaire if any

C. Post-questionnaire if any

D. Participant Information Statement

Q131 · Question 10

View Answer

Select all types of quantitative data that can be measured during the a usability test session.

A. Time taken to complete task.

B. Number of navigations to the online help or manuals.

C. Number of errors made per task.

D. Critical incidents that happen during the test.

Q132 · Question 11

View Answer

Match example evaluation methods to their categories.

A. Evaluation with users under controlled settings

B. Predictive model evaluation

C. Compared with a set of known design rules

D. Large-scale web experiment

A/B Testing

Cognitive walkthrough

Fitts' Law

Heuristic Evaluation

Usability test

Q133 · Question 12

View Answer

Which of the following are type(s) of evaluation conducted without users?

A. - Usability testing

B. - Experiments

C. - Cognitive walkthroughs

D. - Heuristic evaluation

E. - Models (e.g. Fitts' Law)

Q134 · Question 13

View Answer

Which of the following are type(s) of evaluation conducted with users?

A. - Usability testing

B. - Heuristic evaluation

C. - Web analytics

D. - Cognitive walkthroughs

E. - Experiments

Q135 · Question 14

View Answer

A design team has built a medium-fidelity prototype of a new e-textbook interface. They have limited time and budget, and want to identify usability problems before recruiting real users.

Which combination of methods would be most appropriate at this stage, and why? Select all that apply.

A. - A large-scale questionnaire followed by A/B testing: questionnaires efficiently gather broad user opinions, and A/B testing confirms which version performs better statistically.

B. - Heuristic evaluation followed by a think-aloud study: heuristic evaluation is cheap and can identify likely problem areas early, and think-aloud can then probe whether those problems affect real users in practice.

C. - Standard questionnaires (e.g. SUS) administered to the design team: the team can self-assess usability reliably and questionnaires provide validated numeric scores even without real users.

D. - Cognitive walkthrough followed by heuristic evaluation: cognitive walkthrough focuses on learnability by stepping through tasks from a new user's perspective, and heuristic evaluation then checks broader design principles; together they cover complementary expert-based concerns without requiring participants.

E. - Think-aloud followed by cognitive walkthrough: think-aloud should always come first to establish baseline performance data before any expert review is attempted.

Q136 · Question 15

View Answer

Which of the following statements correctly describe heuristic evaluation in UX design?

A. - It requires real users to perform tasks while thinking aloud.

B. - It is an expert-based review method to identify usability issues.

C. - It uses a set of established usability principles as guidelines.

D. - It primarily measures system performance and response time.

E. - It is often conducted early in the design process to catch usability problems.

Q137 · Question 16

View Answer

A UX team is conducting a standard heuristic evaluation. Which steps correctly describe the procedure? Select all that apply.

A. Inspectors work independently through the interface before comparing notes.

B. The final report should prioritise suggestions that yield the largest usability improvement for the lowest cost.

C. Each inspector captures screen images or locations to provide context for identified problems.

D. The group collaborates to merge problem lists, brainstorm fixes, and prioritise recommendations.

E. The team should always use exactly Nielsen's 10 heuristics and no others.

Q138 · Question 17

View Answer

Nielsen's heuristic "Visibility of System Status" is best illustrated by which of the following interface examples? Select all that apply.

A. A progress bar showing percentage completion when downloading a large file.

B. A confirmation dialog asking "Are you sure?" before a payment is processed.

C. Tags selected by the user turning a distinct highlight colour to indicate they are active.

D. A shopping cart icon updating its count immediately after an item is added.

E. An undo button that reverses the last destructive action.

Q139 · Question 18

View Answer

How does Nielsen's heuristic of "Error Prevention" help improve the usability of a system? Select all that apply.

A. By providing accelerators like short-cuts.

B. By displaying a clear error code when something goes wrong.

C. By providing constraints that make invalid inputs impossible.

D. By visualizing the status of the system.

E. By allowing users to undo "slips".

Q140 · Question 19

View Answer

Which of the following statements correctly describe a Cognitive Walkthrough in UX evaluation?

A. It requires real users to perform tasks while thinking aloud.

B. It primarily measures system performance and response time.

C. It is a usability evaluation method focused on how easily new users can learn a system.

D. It involves experts stepping through tasks from a user's perspective.

E. It is used to identify potential usability issues during early design stages.

Q141 · Question 20

View Answer

A design team conducts a cognitive walkthrough of a new university enrolment system to evaluate how well first-time students can add a course. The evaluators step through the interface task by task and ask questions such as: Will the user know what to do at this step? Will the user notice the correct control? Will the user associate the control with the intended outcome?
Which of the following statements correctly characterise cognitive walkthrough as a usability evaluation method? Select all that apply.

A. Cognitive walkthrough primarily evaluates efficiency and error rates based on observed user performance.

B. Cognitive walkthrough focuses on learnability, particularly whether new users can accomplish tasks through exploration and reasoning.

C. Cognitive walkthrough is most effective when used with experienced users performing routine tasks.

D. Cognitive walkthrough assumes users are actively problem-solving, rather than following memorised procedures.

E. Cognitive walkthrough can be conducted without real users, relying on evaluators' systematic reasoning about user cognition.

Q142 · Question 21

View Answer

A product team is deciding between a cognitive walkthrough and a think-aloud study for an early lo-fi prototype. Which statements accurately characterise when a cognitive walkthrough is the more appropriate choice? Select all that apply.

A. The primary concern is learnability — whether new users can figure out the interface without training.

B. The team needs findings quickly and cannot yet recruit and schedule users.

C. The team wants to capture a rich record of genuine reactions to the interface.

D. The team wants to measure task completion time and efficiency for expert users.

E. The prototype is at an early stage where the designer is still willing to make structural changes.

Q143 · Question 22

View Answer

Which of the following statements correctly describe A/B Testing in UX or product design?

A. A/B testing guarantees that the best design will always be chosen.

B. A/B testing is conducted without collecting any user interaction data.

C. A/B testing requires splitting users into groups to test different versions.

D. A/B testing is a controlled experiment to measure the impact of design changes.

E. A/B testing compares two or more design variations to see which performs better.

Q144 · Question 23

View Answer

A team is redesigning a desktop web application used frequently by administrative staff. They want to apply Fitts' Law as a design guideline to improve efficiency of pointer-based interaction.

Which of the following design decisions are correctly justified by Fitts' Law? Select all that apply.

A. Placing frequently used actions near where the pointer is likely to already be (e.g. near the centre of the screen after page load).

B. Placing critical actions along screen edges or in corners, where the pointer cannot overshoot the target.

C. Using bright colours and animation to make important buttons more noticeable, thereby reducing pointing time.

D. Grouping related controls together so that users can remember their locations more easily over time.

E. Increasing the clickable area of small icons by adding invisible padding, even if the visual size of the icon does not change.

Q145 · Question 24

View Answer

Which of the following best describes the principle of informed consent in research involving human participants?

A. Participants can request the results of the study to be shared with them after the study concludes.

B. Participants must be paid for their time and contribution.

C. Participants can opt out from the study at any point during the experiment.

D. Participants must complete a survey before joining.

E. Participants must voluntarily agree to participate after receiving clear information.

Together-subjects design

Within-subjects design

Q156 · Question 7

View Answer

Which of the following statements are FALSE about usability testing?

A. Need many participants

B. Must be replicable

C. Discover new knowledge

D. Conditions do not have to be strongly controlled.

Q157 · Question 8

View Answer

Which of the following needs to be considered during experimental design?

A. Allocation of participants to test conditions

B. Participant selection and recruitment

C. Supervisor's view of experiment

Q158 · Question 9

View Answer

A university dashboard uses the following design choices:

Error states are shown using red text with a red outline around the input field.

Success states are shown using green text with a green outline.

All text meets WCAG AA contrast requirements against the background.

A bar chart uses distinct hues (red, green, blue, purple), but includes no labels on the bars; values are shown only on hover.

A legend is present, but categories are identified only by colour swatches, not by text.

Which of the following statements reflect correct accessibility analysis with respect to colour and colour blindness? Select all that apply:

A. Using four distinct hues avoids colour-blindness issues, because most colour-vision deficiencies affect only red–green discrimination.

B. Meeting WCAG contrast requirements is sufficient to ensure that colour-blind users can correctly interpret all visual distinctions.

C. The error and success states still present an accessibility issue because colour is the only persistent cue distinguishing system states.

D. The bar chart may be inaccessible because information is conveyed by colour without a non-colour redundant encoding.

E. Adding text labels or icons to error/success states would improve accessibility even if colour and contrast remain unchanged.

Q159 · Question 10

View Answer

A hospital has deployed a new bed-management system for ward nurses. Nurses are experienced with the old system, which used a grid view with colour-coded bed statuses. The new system uses a list view with text-only status labels. Nurses are making frequent errors in the first weeks. The UX team identifies this as a mental model problem. Which of the following interventions would directly address it? Select all that apply:

A. Provide training that explains how the list view maps onto the concepts nurses already understand from the grid view

B. Run a heuristic evaluation to identify additional usability problems in the new system

C. Reintroduce colour-coded visual status indicators to align the new interface with nurses' existing mental model

D. Reduce the number of status categories to lower cognitive load

E. Conduct a think-aloud study to measure how long nurses take to locate a specific bed

Q160 · Question 11

View Answer

A design team has created three personas for their e-textbook interface. Persona A is a 45-year-old nurse returning to study who uses a tablet primarily at night after shifts. Persona B is a 22-year-old full-time student who is highly tech-literate and uses multiple devices. Persona C is a 60-year-old who has never used an e-textbook and finds touchscreens uncomfortable.

Which of the following statements about the use of these personas are correct? Select all that apply:

A. Persona B's high tech-literacy means she is the most reliable proxy for all users, and pilot testing with her would be sufficient to identify usability problems for the full user population.

B. Since Persona C has the least digital experience, the team should design exclusively for her needs; a design that works for the least experienced user will automatically satisfy all other personas.

C. A single design solution is unlikely to meet the needs of all three personas equally well, and the team should explicitly consider which persona is primary when making design trade-offs.

D. Personas derived from real user research data (such as auto-ethnography or interviews) are more grounded and useful than personas invented without data, because they reflect actual user behaviour and context rather than designer assumptions.

E. Personas are useful for cognitive walkthroughs because they give evaluators a concrete user perspective to adopt when asking "would this user know what to do next?"

Q161 · Question 12

View Answer

A user's mental model of a digital library search system is that it works like a Google search: typing any natural language phrase will return the most relevant results ranked by relevance. The actual system requires Boolean operators and exact field matching to return useful results.

Which of the following statements correctly describe this situation and its implications? Select all that apply:

A. The mismatch between the user's mental model and the system's actual behaviour is a usability problem, because the user's expectations will lead to strategies that produce poor results.

B. This kind of mismatch is irrelevant to interface design; it is the user's responsibility to learn how the system actually works before using it.

C. Heuristic evaluation could identify this as a violation of the heuristic "Match between system and the real world," because the system uses conventions that do not match users' existing knowledge and expectations.

D. A think-aloud study would be well suited to revealing this mismatch, because users would verbalise their expectations and confusion as they interact with the search interface.

E. Affordances play a role here: if the search box looks identical to a Google search bar with no indication of required syntax, it affords natural language search and actively misleads users about the system's behaviour.

Week 9 - In-Class Quiz

Quiz 16 · 4 questions

Q162 · Question 1

View Answer

What is involved in usability testing?

A. Recording user performance on tasks
B. Ignoring user feedback
C. Observing but not timing the users
D. Using only interviews

Q163 · Question 2

View Answer

What is the main goal of conducting a field study in HCI?

A. To evaluate prototypes in controlled environments
B. To only observe short-term user behavior
C. To understand how users interact with technology in natural settings
D. To test technology without user interaction

Q164 · Question 3

View Answer

In an experiment, what is the dependent variable?

A. The outcome influenced by the independent variable
B. The variable manipulated by the researcher
C. The number of participants
D. The controlled conditions

Q165 · Question 4

View Answer

Which document is essential for getting permission to use data from a participant?

A. Ethics application
B. Informed consent form
C. Pre-questionnaire
D. Non-disclosure agreement

Week 10 - Weekly Quizzes

Quiz 17 · 20 questions

Q166 · Question 1

View Answer

Which HCI evaluation method involves observing users as they interact with a system in a controlled environment?

A. Observations

B. Surveys

C. Interviews

D. Usability testing

Q167 · Question 2

View Answer

Which of the following is NOT a usability heuristic developed by Jakob Nielsen?

A. Error prevention

B. Visibility of system status

C. Match between system and the real world

D. System adaptability

Q168 · Question 3

View Answer

Which HCI evaluation technique involves an expert going through the prototype pretending to be a user of the system

A. Think Aloud

B. Card sorting

C. Eye tracking

D. Cognitive walkthrough

Q169 · Question 4

View Answer

What is the purpose of A/B testing in HCI evaluation?

A. To compare two different user interface designs

B. To assess the user's cognitive load

C. To conduct user interviews

D. To gather demographic information about users

Q170 · Question 5

View Answer

In HCI, what does the term "affordance" refer to?

A. The visual cues that suggest how an object can be used
B. The ability of a user interface to adapt to different devices
C. The perceived value of a product
D. The time it takes for a user to complete a task

Q171 · Question 6

View Answer

Which of the following is a benefit of using paper prototypes in HCI?

A. They are fully functional and represent the final product.
B. They are easy to create and modify.
C. They allow for realistic user interactions.
D. They can be used for quantifying user performance.

Q172 · Question 7

View Answer

In HCI, what is the purpose of usability testing with prototypes?

A. To validate the prototype's visual design
B. To create a final product specification
C. To simulate real-world usage of the final product
D. To uncover usability issues and gather user feedback

Q173 · Question 8

View Answer

Which prototyping technique involves creating a physical model or representation of a user interface using tangible materials like clay or foam?

A. Digital prototyping
B. Physical prototyping
C. Storyboarding
D. Paper prototyping

Q174 · Question 9

View Answer

"Help and documentation" is one of Nielsen's usability heuristics. What does it suggest?

A. Offering context-sensitive help within the interface
B. Providing a dedicated customer support hotline
C. Providing comprehensive user manuals for all software
D. Hiding user assistance options to reduce clutter

Q175 · Question 10

View Answer

"Recognition rather than recall" is one of Nielsen's usability heuristics. What does it mean?

A. Users must remember all interface features without any cues

B. Users should rely on their memory instead of on-screen instructions

C. Recognition is not as important as recall in usability

D. Users should be able to recognise and use features rather than memorise them

Q176 · Question 11

View Answer

Which of the following practices improve web accessibility for users with color blindness?

A. Using patterns or textures in addition to color to differentiate elements

B. Relying solely on color to convey important information

C. Ensuring sufficient contrast between text and background colors

D. Avoiding any use of color in the interface

Q177 · Question 12

View Answer

Which of the following are considered best practices for using color in accessible web design?

A. Using color combinations that are visually appealing without considering accessibility guidelines

B. Providing text labels or icons in addition to color cues

C. Relying solely on color to indicate status or convey information

D. Avoiding the use of any color in the interface to prevent accessibility issues

E. Ensuring sufficient contrast between text and background colors

Q178 · Question 13

View Answer

You are preparing tasks for a formative usability test of a new university learning-management system. Two alternative task descriptions are proposed for testing assignment submission. Task A: "Go to the Assessments page, click 'Submit', upload your PDF file, and press the blue 'Confirm' button to submit Assignment 1." Task B: "You have finished working on Assignment 1 and want to submit it so that your tutor can mark it." Which of the following statements correctly evaluate Task A and Task B according to best practices for good user tasks? Select all that apply.

A. Task A is better because it ensures all users interpret the task in exactly the same way.

B. Task B is problematic because it does not mention specific interface labels, making success hard to judge.

C. Task B is a good user task because it states a realistic user goal without describing how to perform it.

D. Task A and Task B together provide good coverage and frugality, because they test different aspects of the interface.

E. Task A is problematic because it leads the user by specifying interface actions rather than stating a goal.

Q179 · Question 14

View Answer

A usability study evaluates a new online course-registration system intended for all undergraduate students at a large university. The study recruits 12 participants: all are computer science students, all aged 18–22, 10 are male and 2 are female, all report high computer literacy, and most expressed strong interest in technology and volunteered quickly. The study reports that "the system is intuitive, fast to learn, and causes little confusion." Which of the following statements are valid concerns or correct interpretations regarding participant recruitment and the conclusions that can be drawn? Select all that apply.

A. The sample may not be representative because experience and computer literacy are higher than in the intended user population.

B. The limited diversity of the participant group constrains the conclusions primarily to tech-savvy users, rather than the full user population.

C. The conclusions are invalid, because usability studies require participants to match the user population exactly in age and gender.

D. Because the system is intended for undergraduates, recruiting only students aged 18–22 is sufficient to generalise findings.

E. Recruiting participants with strong interest and motivation may bias results toward more positive usability outcomes.

Q180 · Question 15

View Answer

Bharat, Jake, and Tanya conducted a system evaluation for their interface prototype with 2 participants and argued that, according to the famous rule of thumb in HCI, they had the minimum number of participants needed to identify approximately 80% of the UX problems in the system." According to this famous rule of thumb, what is the correct minimum number of participants required for an evaluation?

A. Between 15 and 20

B. At least 5

C. 2 is enough (they are correct)

D. Between 10 and 12

E. 1 is enough

Q181 · Question 16

View Answer

A usability team uses a think-aloud protocol with 4 users on an early prototype. Which of the following statements about think-aloud are correct? Select all that apply.

A. Think-aloud provides accurate task completion times suitable for summative performance comparison.

B. Think-aloud is effective at revealing why usability problems occur, by providing insight into users' reasoning.

C. The act of thinking aloud can slow users down and alter their behaviour, affecting performance measures.

D. Think-aloud can be used early in development with a small number of users and limited resources.

E. Users' verbal explanations always reflect their true cognitive processes and require minimal interpretation.

Q182 · Question 17

View Answer

Which of the following are known limitations or risks of the think-aloud method in usability evaluation? Select all that apply.]

A. The think-aloud setting is unnatural, as users do not normally verbalise their thoughts while performing tasks.

B. The experimenter can bias results, both deliberately (e.g. task choice) and inadvertently (e.g. facial expressions).

C. Users may filter what they say to avoid looking incompetent or to please the evaluator.

D. Think-aloud produces highly reliable objective performance data unaffected by the presence of the evaluator.

E. Think-aloud eliminates the Hawthorne effect, because users focus on verbalising rather than being observed.

Q183 · Question 18

View Answer

"Ross is planning to conduct a study on people's knowledge about human evolution. His study has 3 conditions. However, he only has access to a limited number of participants. Therefore, all the participants will have to undergo all 3 conditions. Given the nature of the study, he decides to hand over a questionnaire where participants will rate their perceptions on Likert scales after each condition. At the end of the study, he plans to interview each participant to further support his survey data. For this, he prepares a set of questions, leaving room to ask more questions to gather richer data." According to the above statement, which of the following best describes the 3 approaches taken by Ross for his study?

A. Within-subject design, mixed-method analysis, semi-structured interview

B. Within-subject design, mixed-method analysis, structured interview

C. Between-subject design, mixed-methods analysis, semi-structured interview

D. Within-subject design, qualitative analysis, semi-structured interview

E. Between-subject design, quantitative analysis, paired t-test

Q184 · Question 19

View Answer

In the context of UX design, what does a Wizard of Oz interaction refer to?

A. A fully automated prototype that mimics real system behavior

B. A usability test where the system's responses are secretly controlled by a human

C. A method used to test concepts before building full functionality

D. A process where users are informed that a human is simulating the system

E. A technique for creating high-fidelity visual mockups

Q185 · Question 20

View Answer

A team is designing a mobile app to support healthy eating behaviour change. They have conducted an auto-ethnography and developed personas. They now want to evaluate a low-fidelity prototype before investing in further development. Which of the following claims about their evaluation options are correct? Select all that apply.

A. A cognitive walkthrough at this stage is appropriate because it can be performed on paper prototypes or wireframes, and it specifically assesses whether a new user could learn to complete key tasks without prior training.

B. Personas developed from auto-ethnography data are useful for cognitive walkthroughs because they provide a concrete, grounded description of the target user's goals, knowledge, and context, allowing evaluators to more realistically assess each step from the user's perspective.

C. Think-aloud with the low-fidelity prototype would help the team understand how users interpret their design choices and whether their mental model of the interface matches what the designers intended.

D. A standard usability questionnaire such as the SUS (System Usability Scale) is ideal for evaluating low-fidelity prototypes because participants can reliably rate a system they have only seen on paper.

E. Heuristic evaluation at this stage is pointless because heuristics can only be applied to finished, fully implemented software.

Week 10 - In-Class Quiz

Quiz 18 · 4 questions

Q186 · Question 1

View Answer

What does WIMP stand for in GUIs?

A. Windows, Icons, Menus, Pointing device
B. Wireless Input Management Platform
C. Widgets, Interactive Modules, Protocols
D. Web Interface Media Protocol

Q187 · Question 2

View Answer

Which interface type is associated with WIMP?

A. Command-Line Interface (CLI)
B. Virtual Reality Interface
C. Tangible User Interface
D. Graphical User Interface (GUI)

Q188 · Question 3

View Answer

Which interaction technique is used by telepresence robots?

A. Click-based navigation
B. Remote control by users
C. Direct file system navigation
D. Batch processing commands

Q189 · Question 4

View Answer

What type of input is commonly used in wearable interfaces?

A. Keyboard-based commands
B. Touch and haptic input
C. Voice-only input
D. Static, gesture-based commands

Week 11 - Weekly Quizzes [Interfaces & CSCW]

Quiz 19 · 12 questions

Q190 · Question 1

View Answer

Which of the following statements are TRUE about Command Line Interfaces (CLI)?

A. It is an old-fashioned interface type that is no longer adopted by any applications.

B. There is usually a picture representation to explain what each line of command means.

C. It can provide better accessibility for the visually impaired as it can be used together with screen readers and speech recognition software.

D. It is usually typed into a command prompt.

Q191 · Question 2

View Answer

Match the description to each term

A. Command-Line Interfaces (CLI)

B. Graphical User Interfaces (GUI)

C. Interactive surfaces

D. Virtual reality

E. Wearable interfaces

Matching choices · alphabetical

Accept the input through keyboard

Are always on and come in various form factors

Are used in smart watches, smart walls, and even in artistic installations

Computer simulated environment, where the sensory experience is artificially created

Intuitive, do not need any expertise, not the most efficient for batch tasks

Q192 · Question 3

View Answer

Which of the following are TRUE about wearable computing?

A. The essence of wearable computing is to embed computers into anythig that we normally use to cover or accessorize our bodies.

B. Wearable interfaces can take on many form factors other formats other than the watch such as accessories, clothes and skin tattoos.

C. The laptop is an example of wearable computing because you place it on your lap.

Q193 · Question 4

View Answer

Match the description to each term.

A. Users are completely immerse in a completely different world from the physical world.

B. User views an overlay of digital graphics over a video stream of the physical world.

C. Virtual objects are part of the real world in real-time.

Matching choices · alphabetical

Augmented Reality

Mixed Reality

Virtual Reality

Q194 · Question 5

View Answer

Which of the following are aspects of Post WIMP interfaces?

A. Naive maths

B. Naive physics

C. Social awareness and skills

D. Spatial awareness and skills

Q195 · Question 6

View Answer

Why do we need to understand the mechanism of face-to-face conversations?

A. Improves my contribution in the Group Project.

B. To design communication tools to support remote conversations between people better.

C. It can be used to design the dialogues that take place between users and chatbots or voice assistants.

D. It is part of the syllabus.

Q196 · Question 7

View Answer

Select the description that explains the difference between each term.

A. Co-presence

B. Telepresence

C. Social presence

Matching choices · alphabetical

Degree of awareness, feeling and reaction to other people who are virtually present in the online environment.

Sense of being in the same virtual place or environment with the team..

Sense of being present while being physically located at a different location.

Q197 · Question 8

View Answer

The time/space groupware matrix classifies collaborative application into four categories. Match the descriptions to explain what each category means.

A. Same time
B. Different time
C. Same place
D. Different place

Matching choices · alphabetical

Asynchronous
Co-located
Remote
Synchronous

Q198 · Question 9

View Answer

Which of the following statements are TRUE about speech interfaces?

A. Speech interfaces enable hands-free interaction
B. Speech interfaces use the exploring interaction style
C. Speech interfaces use the conversing interaction style
D. Speech interfaces use the manipulating interaction style

Q199 · Question 10

View Answer

A university redesigns its online course management dashboard used daily by teaching staff.

In the current design:

- The main dashboard shows 20 equally sized buttons for different actions (e.g. Upload marks, Download roster, Email students, View analytics).
- All buttons are placed in a dense grid in the centre of the screen.
- Frequently used actions are not visually distinguished from rarely used ones.

Two design changes are proposed:

- Proposal A: Move the three most frequently used actions to a large toolbar at the top edge of the screen. Keep the remaining actions in a secondary menu.
- Proposal B: Keep all actions in the same location, but increase the size of every button equally.

The design team claims both proposals will improve usability. Which of the following statements correctly analyse these proposals using Fitts' Law and Hick's Law?

A. Proposal A reduces pointing time because targets at screen edges are faster to acquire, and reduces decision time by limiting the number of visible choices.

B. Proposal A addresses both motor movement time and decision time, whereas Proposal B mainly addresses motor movement time.

C. Hick's Law is irrelevant in this scenario because all actions are equally important to expert users.

D. Proposal B is superior because increasing button size simultaneously reduces pointing time and choice time.

E. Proposal B reduces decision time by increasing button size, which directly lowers choice complexity.

Q200 · Question 11

View Answer

A usability team is evaluating two designs for a medical appointment booking system. The system must support both occasional patients and experienced reception staff.

- Design X presents a single screen with 12 clearly labelled options, all visible at once.
- Design Y presents 4 high-level categories, each revealing 3 options after selection.

The team debates which design better respects Miller's Law. Which of the following statements are correct, based on Miller's Law and its implications?

A. Miller's Law is most relevant when users must hold information in mind, not when all options remain continuously visible.

B. Chunking options into meaningful categories can allow users to manage more total information without increasing memory burden.

C. Design Y is likely to impose a lower working-memory load, because users only need to consider a small number of items at each step.

D. Miller's Law predicts that experienced users will always perform worse with hierarchical designs than with flat designs.

E. Design X violates Miller's Law, because users cannot process more than seven items visually at once.

Q201 · Question 12

View Answer

A usability team studies how performance changes as staff repeatedly use a new case-management system. Task completion times are recorded over several weeks of regular use. The team discusses how the Power Law of Practice should influence both design decisions and usability evaluation.

Which of the following statements are correct, according to the Power Law of Practice?

A. Because users improve with practice, initial inefficiency does not necessarily indicate poor long-term usability.

B. The Power Law implies that evaluating usability only with first-time users can give a misleading picture of long-term performance.

C. The law suggests that interface performance improvements occur at a constant linear rate as experience increases.

D. The Power Law of Practice predicts that performance will eventually reach a point where no further improvement is possible.

E. Performance typically improves rapidly during early use, with smaller incremental gains as practice continues.

Your selection C | Official key C

C. The graying out of buttons to prevent users from proceeding is an example of constraints.

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

C [Correct!] The graying out of buttons to prevent users from proceeding is an example of constraints.. You selected this answer. This was the correct answer.

Canvas review

Quiz 01 · Question 13

Back to Question

Official verified · Fully correct · Canvas 2 / 2 pts

Your selection A | Official key A

A. Usability includes how easy it is for users to learn and use a system effectively

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

A [Correct!] . You selected this answer. This was the correct answer.

A Learnability is one of the core attributes: how quickly a first-time user can accomplish basic tasks. Efficiency covers how well an experienced user performs once they've learned the system. Both sit squarely inside usability.

D is a visibly blank option in Canvas.

Canvas review

Quiz 01 · Question 14

Back to Question

Official verified · Fully correct · Canvas 2 / 2 pts

Your selection B | Official key B

B. A, C

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

B [Correct!] A, C. You selected this answer. This was the correct answer.

B The ISO 9241-210 definition of UX is "a person's perceptions and responses that result from the use and/or anticipated use of a product, system or service" — which is essentially C verbatim. That definition is deliberately broad: it covers emotions, beliefs, preferences, physical and psychological responses, behaviours, and accomplishments, both before and after the interaction as well as during it.

A restates the same idea from a different angle — the quality of the experience while interacting with a design. UX is fundamentally about the felt quality of that encounter, not just whether the task got completed.

Canvas feedback & option evidence

B [Correct!] Recognition is easy; recall is even easier.. You selected this answer. This was the correct answer.

B Recalling is tougher than recognition as there isn't any cues to help you remember.

C [You Answered] Our hand-eye coordination follows laws. An example is Hicks Law which dictates reaction time is dependent on the number of options available.. You selected this answer.

C See this resource:
https://www.interaction-design.org/literature/article/hick-s-law-making-the-choice-easier-for-users

D [Correct!] You are reading this text using your peripheral vision.. You selected this answer. This was the correct answer.

D Are you sure? Our peripheral vision is poor.

Canvas review

Quiz 02 · Question 11

Back to Question

Official verified · Fully correct · Canvas 1 / 1 pts

Your selection C, D | Official key C, D

C. B) Similar colors, shapes, or sizes lead to grouping

D. E) Objects that look similar are perceptually grouped

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

C [Correct!] B) Similar colors, shapes, or sizes lead to grouping. You selected this answer. This was the correct answer.

D [Correct!] E) Objects that look similar are perceptually grouped. You selected this answer. This was the correct answer.

Why B and E are true

The Gestalt principle of similarity says that elements sharing visual characteristics are perceived as belonging to the same group, even when they're not physically closer to each other than to anything else. The shared attributes that drive this are colour, shape, size, orientation, and texture — with colour generally being the strongest.

A classic demonstration: take a grid of evenly spaced dots and make alternating rows red and blue. You'll see horizontal bands, not a uniform grid — despite the spacing being identical in both directions. Similarity is powerful enough to override proximity when the two compete.

Why A, C, and D are false — each is a different Gestalt principle

A — symmetry. Symmetrically arranged elements are perceived as a unified whole, and the balance does reduce perceived complexity. True statement, wrong principle.
C — common fate. Elements moving in the same direction at the same rate are grouped together. This is the one principle that requires motion (or implied motion), which makes it easy to spot as a distractor.
D — continuity (good continuation). We perceive elements arranged along a line or smooth curve as a continuous form rather than as disconnected pieces. It's why we read two crossing lines as two paths passing through each other rather than four segments meeting at a point.

Canvas review

Quiz 02 · Question 12

Back to Question

Official verified · Fully correct · Canvas 1 / 1 pts

Your selection A, B, D, E | Official key A, B, D, E

A. C) Figure is the object of attention, ground is background

B. E) Separation of figure and ground helps guide attention

D. B) Pop-up windows focus attention on the figure

E. A) The visual field is separated into figure (foreground) and ground (background)

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

A [Correct!] C) Figure is the object of attention, ground is background. You selected this answer. This was the correct answer.

B [Correct!] E) Separation of figure and ground helps guide attention. You selected this answer. This was the correct answer.

D [Correct!] B) Pop-up windows focus attention on the figure. You selected this answer. This was the correct answer.

E [Correct!] A) The visual field is separated into figure (foreground) and ground (background). You selected this answer. This was the correct answer.

A and C — the definition. These are near-duplicates. The visual system segregates the field into a figure (which appears closer, has a definite shape, and holds attention) and a ground (which seems to extend continuously behind the figure and is perceived as shapeless). One useful detail: the boundary between them is assigned to the figure, not the ground — which is why the figure has contour and the ground doesn't.
B — an applied example. A modal or pop-up is a textbook case. It's placed on top, often with a drop shadow, and the page behind is dimmed or blurred. Every one of those choices is a deliberate figure/ground manipulation to force the dialogue into the figure role.
E — the functional consequence. Because the separation happens pre-attentively and automatically, designers can use it to control where the eye lands first. Contrast, scale, depth cues, and blur are the standard levers.

Why D is false

"Objects close together are grouped" is the principle of proximity — a grouping principle, concerned with which elements belong with which. Figure/ground isn't a grouping principle at all; it's a segregation principle, concerned with what sits in front of what. Different job entirely.

Your selection B, C | Official key B, C

B. Understanding who the users will be by studying their cognitive, behavioral and attitudinal characteristics.

C. Observing, measuring and analyzing the reactions and performance of intended users to prototypes.

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

B [Correct!] Understanding who the users will be by studying their cognitive, behavioral and attitudinal characteristics.. You selected this answer. This was the correct answer.

C [Correct!] Observing, measuring and analyzing the reactions and performance of intended users to prototypes.. You selected this answer. This was the correct answer.

Canvas review

Quiz 04 · Question 6

Back to Question

Official verified · Fully correct · Canvas 2 / 2 pts

Your selection E | Official key E

E. Observing users in real environments performing tasks

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

E [Correct!] Observing users in real environments performing tasks. You selected this answer. This was the correct answer.

E Understanding the context of use means learning who the users are, what tasks they perform, and the physical, social, and technical environment in which they'll use the product. Direct observation in real settings (a field study or contextual inquiry) is the most critical strategy because it reveals things users can't or won't articulate themselves — workarounds, interruptions, environmental constraints, and how tasks actually unfold in practice.

Canvas review

Quiz 04 · Question 7

Back to Question

Official verified · Fully correct · Canvas 2 / 2 pts

Your selection D | Official key D

D. represent a model that captures a set of activities and how they are related.

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

D [Correct!] represent a model that captures a set of activities and how they are related.. You selected this answer. This was the correct answer.

Canvas review

Quiz 04 · Question 8

Back to Question

Official verified · Fully correct · Canvas 3 / 3 pts

Your selection A, C, D | Official key A, C, D

A. Synthesizing research insights

C. Mapping user needs

D. Creating a clear problem statement

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

A [Correct!] Synthesizing research insights. You selected this answer. This was the correct answer.

A The Define phase is the convergent half of the first diamond, where the broad research gathered during Discover is narrowed down into a focused design challenge. This involves synthesizing research insights to make sense of everything learned.

C [Correct!] Mapping user needs. You selected this answer. This was the correct answer.

C The Define phase is the convergent half of the first diamond, where the broad research gathered during Discover is narrowed down into a focused design challenge. This involves mapping and organizing user needs to identify what matters most.

D [Correct!] Creating a clear problem statement. You selected this answer. This was the correct answer.

D The Define phase is the convergent half of the first diamond, where the broad research gathered during Discover is narrowed down into a focused design challenge. This involves distilling all of it into a clear problem statement or design brief that frames what the team will actually solve.

Canvas review

Quiz 04 · Question 9

Back to Question

Official verified · Fully correct · Canvas 3 / 3 pts

Your selection A, C, D | Official key A, C, D

A. User-centered design helps designer move away from their preferences and focus on the users' needs and goals.

C. Users sometimes don't know what they want.

D. User-centered design can result in the development of a wrong product if the wrong set or type of users are chosen.

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

A [Correct!] User-centered design helps designer move away from their preferences and focus on the users' needs and goals.. You selected this answer. This was the correct answer.

C [Correct!] Users sometimes don't know what they want.. You selected this answer. This was the correct answer.

D [Correct!] User-centered design can result in the development of a wrong product if the wrong set or type of users are chosen.. You selected this answer. This was the correct answer.

Canvas review

Quiz 04 · Question 10

Back to Question

Official verified · Fully correct · Canvas 3 / 3 pts

Your selection A, D, E | Official key A, D, E

A. Usability includes how easy it is for users to learn and use a system effectively.

D. Usability involves evaluating user satisfaction with a product.

E. Usability helps identify and reduce user errors during interaction with a system.

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

A [Correct!] Usability includes how easy it is for users to learn and use a system effectively.. You selected this answer. This was the correct answer.

A This is true: usability centers on learnability and effectiveness — can users figure out how to use the system, and use it well once they know how.

D [Correct!] Usability involves evaluating user satisfaction with a product.. You selected this answer. This was the correct answer.

D This is true: usability is typically measured partly through user satisfaction — do people feel good about the experience, not just able to complete tasks.

E [Correct!] Usability helps identify and reduce user errors during interaction with a system.. You selected this answer. This was the correct answer.

E This is true: a big part of usability work is spotting where users slip up and redesigning to prevent those errors.

Canvas review

Quiz 04 · Question 11

Back to Question

Official verified · Fully correct · Canvas 3 / 3 pts

Your selection A, B, D | Official key A, B, D

A. to understand the activities that people want to undertake and the contexts in which those activities take place.

B. understand the people who will use their systems, services and products.

D. to know about the features of interactive technologies and how to approach designing interactive systems and services that deliver a good UX.

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

A [Correct!] to understand the activities that people want to undertake and the contexts in which those activities take place.. You selected this answer. This was the correct answer.

B [Correct!] understand the people who will use their systems, services and products.. You selected this answer. This was the correct answer.

D [Correct!] to know about the features of interactive technologies and how to approach designing interactive systems and services that deliver a good UX.. You selected this answer. This was the correct answer.

Canvas review

Quiz 04 · Question 12

Back to Question

Official verified · Fully correct · Canvas 3 / 3 pts

Your selection C, D, E | Official key C, D, E

C. User reactions are measured to validate design assumptions

D. Design decisions are based on user performance data

E. Feedback is gathered through simulations and prototypes

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

C [Correct!] User reactions are measured to validate design assumptions. You selected this answer. This was the correct answer.

C Empirical measurement, another of Gould and Lewis's principles, means that design decisions should be grounded in observed data rather than intuition. That includes measuring user reactions and performance to validate, or challenge, the assumptions designers have made.

D [Correct!] Design decisions are based on user performance data. You selected this answer. This was the correct answer.

D Empirical measurement, another of Gould and Lewis's principles, means that design decisions should be grounded in observed data rather than intuition. That includes basing decisions on actual user performance data

E [Correct!] Feedback is gathered through simulations and prototypes. You selected this answer. This was the correct answer.

E Empirical measurement, another of Gould and Lewis's principles, means that design decisions should be grounded in observed data rather than intuition. That includes gathering feedback early using simulations and prototypes that users can interact with.

Quiz 04 · Question 16

Back to Question

Official verified · Fully correct · Canvas 3 / 3 pts

Your selection A, B, D, E | Official key A, B, D, E

A. To determine possible current user expectations.

B. To understand the context for which it will be used.

D. To reduce misunderstanding between team members.

E. To determine the purpose of design.

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

A [Correct!] To determine possible current user expectations.. You selected this answer. This was the correct answer.

B [Correct!] To understand the context for which it will be used.. You selected this answer. This was the correct answer.

D [Correct!] To reduce misunderstanding between team members.. You selected this answer. This was the correct answer.

E [Correct!] To determine the purpose of design.. You selected this answer. This was the correct answer.

Canvas review

Quiz 04 · Question 17

Back to Question

Official verified · Fully correct · Canvas 3 / 3 pts

Your selection A, C | Official key A, C

A. It increases the likelihood of user acceptance

C. It helps uncover real user needs and pain points

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

A [Correct!] It increases the likelihood of user acceptance. You selected this answer. This was the correct answer.

A User involvement is critical because users who participate in the design process develop a sense of ownership, which increases the likelihood they'll accept and adopt the final.

C [Correct!] It helps uncover real user needs and pain points. You selected this answer. This was the correct answer.

C User involvement is critical because it helps uncover real user needs, expectations, and pain points that designers couldn't discover on their own.

Canvas review

Quiz 04 · Question 18

Back to Question

Official verified · Fully correct · Canvas 3 / 3 pts

Your selection A, E | Official key A, E

A. Observing how users perform real-world tasks

E. Understanding user goals and contexts before prototyping

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

A [Correct!] Observing how users perform real-world tasks. You selected this answer. This was the correct answer.

A Early focus on users and tasks (one of Gould and Lewis's classic principles of user-centered design) means engaging with users from the very beginning of the design process — observing how they actually perform real-world tasks (B)

E [Correct!] Understanding user goals and contexts before prototyping. You selected this answer. This was the correct answer.

E Early focus on users and tasks (one of Gould and Lewis's classic principles of user-centered design) means engaging with users from the very beginning of the design process - understanding their goals, needs, and contexts before any prototyping or design work begins (D).

Canvas review

Quiz 04 · Question 19

Back to Question

Official verified · Fully correct · Canvas 3 / 3 pts

Your selection A, D, E | Official key A, D, E

A. Develop initial prototypes, then refine them using real user feedback

D. Use both qualitative and quantitative feedback to inform design

E. Iterate on designs, prioritising high-impact usability issues

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

A [Correct!] Develop initial prototypes, then refine them using real user feedback. You selected this answer. This was the correct answer.

A Iterative design means the design-test-refine cycle repeats until the product works well for users. That involves building early prototypes and refining them based on real user feedback.

D [Correct!] Use both qualitative and quantitative feedback to inform design. You selected this answer. This was the correct answer.

D Iterative design means the design-test-refine cycle repeats until the product works well for users. That involves drawing on both qualitative feedback (observations, comments, frustrations) and quantitative measures (task completion times, error rates) to guide changes.

E [Correct!] Iterate on designs, prioritising high-impact usability issues. You selected this answer. This was the correct answer.

E Iterative design means the design-test-refine cycle repeats until the product works well for users. That involves iterating repeatedly while prioritizing the usability problems that have the greatest impact on users.

Your selection B, C, D, E | Official key B, C, D, E

B. Improving the layout of an e-commerce product page, where the primary goal is to optimise visual hierarchy and calls to action.

C. Studying how doctors make rapid diagnostic decisions during emergency procedures, when they cannot be interrupted.

D. Observing air-traffic controllers during live operations, where interruptions could compromise safety and performance.

E. Redesigning a newsletter sign-up form to reduce drop-off, where the interaction consists of a small number of simple fields.

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

B [Correct!] Improving the layout of an e-commerce product page, where the primary goal is to optimise visual hierarchy and calls to action.. You selected this answer. This was the correct answer.

C [Correct!] Studying how doctors make rapid diagnostic decisions during emergency procedures, when they cannot be interrupted.. You selected this answer. This was the correct answer.

D [Correct!] Observing air-traffic controllers during live operations, where interruptions could compromise safety and performance.. You selected this answer. This was the correct answer.

E [Correct!] Redesigning a newsletter sign-up form to reduce drop-off, where the interaction consists of a small number of simple fields.. You selected this answer. This was the correct answer.

Contextual inquiry observes users doing real tasks and interrupts to ask why. Its full form needs two things:

(1) you can safely interrupt the work, and (2) the task is cognitively rich enough to justify deep observation. It fails when either is missing.
Why four of the situations fail — two buckets:
Too simple (no hidden reasoning):
Newsletter sign-up — a few simple fields. Trivial; A/B testing or analytics fit better.
E-commerce page layout/visual hierarchy — a surface design problem, better served by A/B tests or eye-tracking.
Can't interrupt (the dialogue is impossible):
Air-traffic controllers live — interrupting risks safety.
Doctors in emergencies — cannot be interrupted.
Why the remaining situation is the exception (it works): Accountants reasoning about complex tax cases — the reasoning is hidden and cognitively rich, and the work can be interrupted to ask "why?" Both conditions met, so contextual inquiry genuinely fits.
So the newsletter form and the e-commerce page are too trivial, the air-traffic controllers and the emergency doctors are too uninterruptible; only the accountants case satisfies both requirements.

Canvas review

Quiz 06 · Question 16

Back to Question

Official verified · Fully correct · Canvas 2 / 2 pts

Your selection B, D, E | Official key B, D, E

B. They are inexpensive to administer

D. They have established reliability and validity

E. Their scores can be compared across studies and interfaces

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

B [Correct!] They are inexpensive to administer. You selected this answer. This was the correct answer.

D [Correct!] They have established reliability and validity. You selected this answer. This was the correct answer.

E [Correct!] Their scores can be compared across studies and interfaces. You selected this answer. This was the correct answer.

Correct answers: "They have established reliability and validity", "Their scores can be compared across studies and interfaces", "They are inexpensive to administer"

Explanation: The genuine advantages are proven reliability/validity, cross-study comparability, and low cost. "Completely open-ended responses" describes open-ended methods (the opposite of a standardised scale), and "automatically diagnose specific usability problems" wrongly credits questionnaires with diagnostic power they don't have.

Canvas review

Quiz 06 · Question 17

Back to Question

Official verified · Fully correct · Canvas 1 / 1 pts

Your selection A, D, E | Official key A, D, E

A. The sample may not be representative because experience and computer literacy are higher than in the intended user population.

D. The limited diversity of the participant group constrains the conclusions primarily to tech-savvy users, rather than the full user population.

E. Recruiting participants with strong interest and motivation may bias results toward more positive usability outcomes.

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

A [Correct!] The sample may not be representative because experience and computer literacy are higher than in the intended user population.. You selected this answer. This was the correct answer.

D [Correct!] The limited diversity of the participant group constrains the conclusions primarily to tech-savvy users, rather than the full user population.. You selected this answer. This was the correct answer.

E [Correct!] Recruiting participants with strong interest and motivation may bias results toward more positive usability outcomes.. You selected this answer. This was the correct answer.

Correct answers: "The sample may not be representative…", "Recruiting participants with strong interest and motivation may bias results…", "The limited diversity of the participant group constrains the conclusions…"

Explanation: The question is about representativeness in participant recruitment — whether the sample matches the intended user population well enough to support the study's conclusions. The system is for all undergraduate students, a broad and diverse population. But the sample is narrow: all computer science students, all highly computer-literate, mostly male, and self-selected tech enthusiasts who volunteered quickly. The valid points are that the sample is more skilled than the population, that self-selected enthusiasts bias results positive, and that findings only generalise to tech-savvy users. The statement that studies require exact matching in age and gender overstates the requirement (and "invalid" is too strong), and the statement that matching age alone is sufficient for generalisation is wrong.

B [Correct!] False. You selected this answer. This was the correct answer.

Canvas review

Quiz 08 · Question 2

Back to Question

Official verified · Fully correct · Canvas 2 / 2 pts

Your selection A | Official key A

A. Interviews can be used almost in any stage of the project

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

A [Correct!] Interviews can be used almost in any stage of the project. You selected this answer. This was the correct answer.

Canvas review

Quiz 08 · Question 3

Back to Question

Official verified · Fully correct · Canvas 2 / 2 pts

Your selection B | Official key B

B. Contextual Inquiry

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

B [Correct!] Contextual Inquiry. You selected this answer. This was the correct answer.

B Two features of the scenario together settle it. The researcher is present while the user performs a real task — that is the observation half. And the researcher asks about reasoning, difficulties and expectations as the work proceeds — that is the interview half. The lecture defines contextual inquiry as exactly that combination, and the comparison table describes the contextual-inquiry researcher as an "interviewer/observer who asks clarifying questions while the user works."

Canvas feedback & option evidence

D [Correct!] Can be used to organize language data into themes.. You selected this answer. This was the correct answer.

Canvas review

Quiz 08 · Question 5

Back to Question

Official verified · Fully correct · Canvas 2 / 2 pts

Your selection B | Official key B

B. Observation

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

B [Correct!] Observation. You selected this answer. This was the correct answer.

B The decisive phrase is "without interrupting them." The lecture’s silent observation is defined as the designer watching the user work with "no communication during observation" — which is exactly this. What is being collected also fits: how long tasks take, where users hesitate, which features get used are all behavioural data, the kind observation yields.

Canvas review

Quiz 08 · Question 6

Back to Question

Official verified · Fully correct · Canvas 3 / 3 pts

Your selection A, D | Official key A, D

A. Can be used to inform design decisions

D. They are created from data collected from actual people.

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

A [Correct!] Can be used to inform design decisions. You selected this answer. This was the correct answer.

D [Correct!] They are created from data collected from actual people.. You selected this answer. This was the correct answer.

Canvas review

Quiz 08 · Question 7

Back to Question

Official verified · Fully correct · Canvas 3 / 3 pts

Your selection A, B, C, D | Official key A, B, C, D

A. Captures context-specific behaviors and decisions

B. Helps uncover unarticulated user needs

C. Reveals real-world workflows and pain points

D. Provides rich qualitative data for design insights

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

A [Correct!] Captures context-specific behaviors and decisions. You selected this answer. This was the correct answer.

A This is the Context principle in one line: going to the user, wherever they are, and seeing what they do as they do it.

B [Correct!] Helps uncover unarticulated user needs. You selected this answer. This was the correct answer.

B This is what Partnership and Interpretation are for: the user and interviewer explore the user's work together and interpret the observations together, which surfaces things the user would never have thought to volunteer in a plain interview.

C [Correct!] Reveals real-world workflows and pain points. You selected this answer. This was the correct answer.

C This restates the output the lecture assigns it in the comparison table — "insights into workflow, usability issues, and user needs."

D [Correct!] Provides rich qualitative data for design insights. You selected this answer. This was the correct answer.

D This follows from what the method produces — observations and conversation, which the lecture classifies as qualitative data (words and images rather than numbers).

A [Correct!] Person. You selected this answer. This was the correct answer.

B [Correct!] User. You selected this answer. This was the correct answer.

Canvas review

Quiz 08 · Question 9

Back to Question

Official verified · Fully correct · Canvas 3 / 3 pts

Your selection B, C, D, E | Official key B, C, D, E

B. Studying how doctors make rapid diagnostic decisions during emergency procedures, when they cannot be interrupted

C. Improving the layout of an e-commerce product page, where the primary goal is to optimise visual hierarchy and calls to action

D. Redesigning a newsletter sign-up form to reduce drop-off, where the interaction consists of a small number of simple fields

E. Observing air-traffic controllers during live operations, where interruptions could compromise safety and performance

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

B [Correct!] Studying how doctors make rapid diagnostic decisions during emergency procedures, when they cannot be interrupted. You selected this answer. This was the correct answer.

B Contextual inquiry in its full form needs two conditions, and both come straight out of its four principles. The Partnership and Interpretation principles require that user and researcher can talk while the work is happening, because the observations are interpreted together. The Context and Focus principles are only worth their cost when there is something in the work worth going to see.

This fails the first condition. A sign-up form of a few fields, and the visual hierarchy of a product page, contain no hidden reasoning to uncover.

C [Correct!] Improving the layout of an e-commerce product page, where the primary goal is to optimise visual hierarchy and calls to action. You selected this answer. This was the correct answer.

C Contextual inquiry in its full form needs two conditions, and both come straight out of its four principles. The Partnership and Interpretation principles require that user and researcher can talk while the work is happening, because the observations are interpreted together. The Context and Focus principles are only worth their cost when there is something in the work worth going to see

This fails the second. The comparison table prices contextual inquiry at hours or several visits — a cost that only pays back when the work is cognitively rich.

D [Correct!] Redesigning a newsletter sign-up form to reduce drop-off, where the interaction consists of a small number of simple fields. You selected this answer. This was the correct answer.

D Contextual inquiry in its full form needs two conditions, and both come straight out of its four principles. The Partnership and Interpretation principles require that user and researcher can talk while the work is happening, because the observations are interpreted together. The Context and Focus principles are only worth their cost when there is something in the work worth going to see.

This fails the second.

E [Correct!] Observing air-traffic controllers during live operations, where interruptions could compromise safety and performance. You selected this answer. This was the correct answer.

Quiz 08 · Question 9 · Continued

Back to Question

E Contextual inquiry in its full form needs two conditions, and both come straight out of its four principles. The Partnership and Interpretation principles require that user and researcher can talk while the work is happening, because the observations are interpreted together. The Context and Focus principles are only worth their cost when there is something in the work worth going to see

This fails the first condition. Air-traffic controllers in live operations and doctors mid-emergency cannot be interrupted; asking "why did you just do that?" is unsafe or impossible.

Canvas review

Quiz 08 · Question 10

Back to Question

Official verified · Fully correct · Canvas 3 / 3 pts

Your selection B, C, D | Official key B, C, D

B. Personas make it easier to argue whether a given feature should be included by testing it against a named individual

C. Personas prevent designers from unconsciously designing for themselves by anchoring decisions to someone specific

D. Personas give the whole organisation a shared, concrete reference for who they are designing for

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

B [Correct!] Personas make it easier to argue whether a given feature should be included by testing it against a named individual. You selected this answer. This was the correct answer.

B This follows from "helps designer make design decisions": a named persona converts "would users want this?" from an argument into a question with a checkable answer.

C [Correct!] Personas prevent designers from unconsciously designing for themselves by anchoring decisions to someone specific. You selected this answer. This was the correct answer.

C This is the most directly supported of the three. The lecture names "self-referential" as one of the three things a good persona avoids: designing for yourself, because you are the user closest to hand and the easiest to consult.

D [Correct!] Personas give the whole organisation a shared, concrete reference for who they are designing for. You selected this answer. This was the correct answer.

D This follows from the stated purpose of reminding the team who will use the product — the value is not just that someone is described, but that everyone is picturing the same someone.

Quiz 08 · Question 12

Back to Question

Official verified · Incorrect selections or matches · Canvas 1.5 / 3 pts

Your selection A, B, D, E | Official key A, B, C, E

A. Ensuring data is recorded accurately and unobtrusively

B. Choosing between overt and covert observation

C. The observer's presence may influence participant behavior

E. Deciding on the duration and timing of observation sessions

Missing selections C | Incorrect selections or matches D

Canvas status partial_credit · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

A [Correct!] Ensuring data is recorded accurately and unobtrusively. You selected this answer. This was the correct answer.

A This is the other half of that same sentence: recording unobtrusively is the goal, but not at the cost of accuracy or of the participant’s knowledge.

B [Correct!] Choosing between overt and covert observation. You selected this answer. This was the correct answer.

B This is the overt/covert choice, which the lecture raises in its sharpest form under interaction logging — it is "unobtrusive to participants but issue of participants privacy if done without their knowledge."

C [Correct Answer] The observer's presence may influence participant behavior. This was the correct answer.

D [You Answered] Only observing in laboratory settings. You selected this answer.

D This is the one that fails. Going to where the work actually happens is the defining commitment of contextual inquiry ("going to the user, wherever they are, and seeing what they do as they do it") and of ethnography (immersion in the culture being studied). Confining observation to a laboratory would discard exactly the context that makes observation worth doing.

E [Correct!] Deciding on the duration and timing of observation sessions. You selected this answer. This was the correct answer.

E This follows from Robson’s observation framework, which includes Time — "what is the sequence of events?" You cannot capture a sequence without first deciding when to watch and for how long.

Canvas review

Quiz 08 · Question 13

Back to Question

Official verified · Fully correct · Canvas 3 / 3 pts

Your selection A, D, E | Official key A, D, E

A. Personas are useful during design reviews because they give the team a concrete user perspective to adopt when asking "would this user know what to do next?"

D. Personas derived from real user research data are more grounded and useful than personas invented without data, because they reflect actual user behaviour and context rather than designer assumptions

E. A single design solution is unlikely to meet the needs of all three personas equally well, and the team should explicitly consider which persona is primary when making design trade-offs

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

A [Correct!] Personas are useful during design reviews because they give the team a concrete user perspective to adopt when asking "would this user know what to do next?". You selected this answer. This was the correct answer.

A A is the practical use — the persona gives the team a specific person to reason as when reviewing a design.

D [Correct!] Personas derived from real user research data are more grounded and useful than personas invented without data, because they reflect actual user behaviour and context rather than designer assumptions. You selected this answer. This was the correct answer.

D This restates the definition: a persona is "synthesized from real people based on user research", so one invented without data is simply a designer assumption wearing a name and a photograph.

E [Correct!] A single design solution is unlikely to meet the needs of all three personas equally well, and the team should explicitly consider which persona is primary when making design trade-offs. You selected this answer. This was the correct answer.

E This follows directly from the persona type hierarchy. If a single design served every user equally well, there would be no reason to distinguish primary from secondary from supplementary — naming a primary persona is exactly the mechanism for resolving trade-offs when three sets of needs cannot all be optimised at once.

Quiz 08 · Question 14

Back to Question

Official verified · Fully correct · Canvas 3 / 3 pts

Your selection A, B, C, D | Official key A, B, C, D

A. Observer bias may affect data interpretation

B. Limited ability to understand participant motivations

C. Time-consuming and resource-intensive

D. Participants may alter behavior if they know they are being observed

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

A [Correct!] Observer bias may affect data interpretation. You selected this answer. This was the correct answer.

A This is one of the standard threats to observational validity: the observer interprets what they see, and the observed adjust because they are seen.

B [Correct!] Limited ability to understand participant motivations. You selected this answer. This was the correct answer.

B This is the structural limitation of watching alone: observation tells you what people do, not why they do it. This is precisely why contextual inquiry exists as a separate technique — it bolts an interview onto the observation so the researcher can ask. It is also why the lecture's combining-techniques slide gives observation the job of studying the context of the activity while interviews supply the views of specific users.

C [Correct!] Time-consuming and resource-intensive. You selected this answer. This was the correct answer.

C This is stated almost verbatim in the lecture's treatment of direct observation: it "requires time and commitment from a member of the design team" and "can result in a huge amount of data." The cost lands at both ends — collecting the data, and then working through it.

D [Correct!] Participants may alter behavior if they know they are being observed. You selected this answer. This was the correct answer.

D This is one of the standard threats to observational validity: the observer interprets what they see, and the observed adjust because they are seen.

Official verified · Fully correct · Canvas 3 / 3 pts

Your selection A, B, C | Official key A, B, C

A. "Join a group on Canvas" should be set as Task 0.

B. Sub-task "Scroll to Group of choice" and "Click 'Join' "should be set to Task 3 and Task 4 respectively.

C. To perform sub-task 1, plan 1 should be do 1.1 then 1.2

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

A [Correct!] "Join a group on Canvas" should be set as Task 0.. You selected this answer. This was the correct answer.

B [Correct!] Sub-task "Scroll to Group of choice" and "Click 'Join' "should be set to Task 3 and Task 4 respectively.. You selected this answer. This was the correct answer.

C [Correct!] To perform sub-task 1, plan 1 should be do 1.1 then 1.2. You selected this answer. This was the correct answer.

Canvas review

Quiz 08 · Question 16

Back to Question

Official verified · Fully correct · Canvas 3 / 3 pts

Your selection A, C, D | Official key A, C, D

A. A persona is a fictional character representing a user type based on research

C. A persona helps designers empathize with users and guide design decisions

D. A persona includes demographic details, goals, and behaviors

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

A [Correct!] A persona is a fictional character representing a user type based on research. You selected this answer. This was the correct answer.

A The lecture’s definition holds two things in tension, and this captures both at once: a persona is "synthesized from real people based on user research" — grounded in evidence, not invented — and yet it is a synthesis, a representative type rather than any one individual.

C [Correct!] A persona helps designers empathize with users and guide design decisions. You selected this answer. This was the correct answer.

C This is the purpose the lecture states directly: a good persona "helps designer make design decisions and reminds team about who will use the product."

D [Correct!] A persona includes demographic details, goals, and behaviors. You selected this answer. This was the correct answer.

D This matches the instruction to "bring to life with name, characteristics, goals, and personal background" — enough concrete detail that the team can picture someone.

Canvas review

Quiz 08 · Question 18

Back to Question

Official verified · Fully correct · Canvas 3 / 3 pts

Your selection A, C, D | Official key A, C, D

A. Designing for a primary persona liberates the team from covering every possible user need, allowing focused, high-satisfaction outcomes for a real subgroup

C. Personas help end feature debates by anchoring decisions to a specific individual rather than hypothetical users

D. A design made specifically for the primary persona should work satisfactorily for all selected personas, even if not optimally

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

A [Correct!] Designing for a primary persona liberates the team from covering every possible user need, allowing focused, high-satisfaction outcomes for a real subgroup. You selected this answer. This was the correct answer.

A This gives the reason for working this way — committing to one target lets the team stop trying to satisfy everyone at once, which is what produces a design that somebody actually likes rather than one nobody minds.

C [Correct!] Personas help end feature debates by anchoring decisions to a specific individual rather than hypothetical users. You selected this answer. This was the correct answer.

C This is the stated purpose of personas generally: they help the designer make design decisions, and they do it by replacing an argument about hypothetical users with a question about a named one.

D [Correct!] A design made specifically for the primary persona should work satisfactorily for all selected personas, even if not optimally. You selected this answer. This was the correct answer.

D The lecture defines the primary persona as "the target of the interface", and defines the secondary persona as "primary needs + additional features". That structure is what this answer describes: you design for the primary persona, and the others are then served by that same design plus adjustments, rather than by separate designs.

Quiz 10 · Question 13

Back to Question

Official verified · Fully correct · Canvas 2 / 2 pts

Your selection A, C, D | Official key A, C, D

A. Hi-fi prototypes can cause stakeholders to mistakenly believe the product is more complete than it is.

C. Hi-fi prototypes allow users to explore system functionality more independently, without requiring a guided narrative from the evaluator.

D. Users evaluatinUsers evaluating hi-fi prototypes sometimes focus disproportionately on superficial visual details rather than core usability issues.

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

A [Correct!] Hi-fi prototypes can cause stakeholders to mistakenly believe the product is more complete than it is.. You selected this answer. This was the correct answer.

C [Correct!] Hi-fi prototypes allow users to explore system functionality more independently, without requiring a guided narrative from the evaluator.. You selected this answer. This was the correct answer.

D [Correct!] Users evaluatinUsers evaluating hi-fi prototypes sometimes focus disproportionately on superficial visual details rather than core usability issues.. You selected this answer. This was the correct answer.

Correct answers: "Hi-fi prototypes can cause stakeholders to mistakenly believe the product is more complete than it is", "Users evaluating hi-fi prototypes sometimes focus disproportionately on superficial visual details rather than core usability issues", "Hi-fi prototypes allow users to explore system functionality more independently, without requiring a guided narrative from the evaluator"

Explanation: Hi-fi prototypes support more independent exploration, but their polished appearance may suggest that the product is nearly complete and may draw attention toward superficial visual details. Lo-fi prototypes are better suited to early concepts and structural changes, while hi-fi prototypes are more appropriate for fine-grained interaction details.

Canvas review

Quiz 10 · Question 14

Back to Question

Official verified · Fully correct · Canvas 2 / 2 pts

Your selection A, C, D | Official key A, C, D

A. The prototype is at an early stage where the designer is still willing to make structural changes.

C. The primary concern is learnability—whether new users can figure out the interface without training.

D. The team needs findings quickly and cannot yet recruit and schedule users.

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

A [Correct!] The prototype is at an early stage where the designer is still willing to make structural changes.. You selected this answer. This was the correct answer.

C [Correct!] The primary concern is learnability—whether new users can figure out the interface without training.. You selected this answer. This was the correct answer.

D [Correct!] The team needs findings quickly and cannot yet recruit and schedule users.. You selected this answer. This was the correct answer.

Correct answers: "The team needs findings quickly and cannot yet recruit and schedule users", "The primary concern is learnability—whether new users can figure out the interface without training", "The prototype is at an early stage where the designer is still willing to make structural changes"

Explanation: A cognitive walkthrough is an expert-based method that does not require recruiting users. It is especially useful for assessing first-time learnability and can be applied early, while the design is still easy to change. It is not intended to measure expert-user efficiency or capture genuine user reactions.

Quiz 10 · Question 15

Back to Question

Official verified · Fully correct · Canvas 2 / 2 pts

Your selection B, C, D, E | Official key B, C, D, E

B. Affordances play a role here: if the search box looks identical to a Google search bar with no indication of required syntax, it affords natural-language search and actively misleads users about the system's behaviour.

C. A think-aloud study would be well suited to revealing this mismatch, because users would verbalise their expectations and confusion as they interact with the search interface.

D. Heuristic evaluation could identify this as a violation of the heuristic "Match between system and the real world," because the system uses conventions that do not match users' existing knowledge and expectations.

E. The mismatch between the user's mental model and the system's actual behaviour is a usability problem, because the user's expectations will lead to strategies that produce poor results.

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

B [Correct!] Affordances play a role here: if the search box looks identical to a Google search bar with no indication of required syntax, it affords natural-language search and actively misleads users about the system's behaviour.. You selected this answer. This was the correct answer.

C [Correct!] A think-aloud study would be well suited to revealing this mismatch, because users would verbalise their expectations and confusion as they interact with the search interface.. You selected this answer. This was the correct answer.

D [Correct!] Heuristic evaluation could identify this as a violation of the heuristic "Match between system and the real world," because the system uses conventions that do not match users' existing knowledge and expectations.. You selected this answer. This was the correct answer.

E [Correct!] The mismatch between the user's mental model and the system's actual behaviour is a usability problem, because the user's expectations will lead to strategies that produce poor results.. You selected this answer. This was the correct answer.

Correct answers: "The mismatch between the user's mental model and the system's actual behaviour is a usability problem…", "A think-aloud study would be well suited to revealing this mismatch…", "Affordances play a role here…", "Heuristic evaluation could identify this as a violation of the heuristic 'Match between system and the real world'…"

Explanation: The user's mental model conflicts with the system's actual operation. Think-aloud can reveal the user's expectations and confusion; the search box's appearance may create a misleading affordance; and the design may violate the heuristic "Match between system and the real world."

Quiz 13 · Question 11

Back to Question

Official verified · Fully correct · Canvas 4 / 4 pts

A. Evaluation with users under controlled settings
Your match Usability test
Official match Usability test

B. Predictive model evaluation
Your match Fitts' Law
Official match Fitts' Law

C. Compared with a set of known design rules
Your match Heuristic Evaluation
Official match Heuristic Evaluation

D. Large-scale web experiment
Your match A/B Testing
Official match A/B Testing

Canvas status correct · Each matching row marks the selected match as correct or explicitly reveals the correct match.

Canvas feedback & option evidence

A [Correct!] Evaluation with users under controlled settings. You selected Usability test. This was the correct answer.

B [Correct!] Predictive model evaluation. You selected Fitts' Law. This was the correct answer.

C [Correct!] Compared with a set of known design rules. You selected Heuristic Evaluation. This was the correct answer.

D [Correct!] Large-scale web experiment. You selected A/B Testing. This was the correct answer.

Other Incorrect Match Options:
Cognitive walkthrough

The matching review shows the items, selected matches and published feedback, without the original dropdown order.
Canvas review

Quiz 13 · Question 12

Back to Question

Official verified · Fully correct · Canvas 3 / 3 pts

Your selection C, D, E | Official key C, D, E

C. - Cognitive walkthroughs

D. - Heuristic evaluation

E. - Models (e.g. Fitts' Law)

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

C [Correct!] - Cognitive walkthroughs. You selected this answer. This was the correct answer.

C "Cognitive walkthroughs" is correct because it is an inspection method — one or more experts walk through the design prototype with a usage scenario and answer the walkthrough questions on the user's behalf. A listed benefit is precisely that it can be done without users.

D [Correct!] - Heuristic evaluation. You selected this answer. This was the correct answer.

D "Heuristic evaluation" is correct because a small set of expert evaluators examines the interface and judges its compliance with recognised usability principles. Its stated benefit is that there are few ethical and practical issues to consider because users are not involved.

E [Correct!] - Models (e.g. Fitts' Law). You selected this answer. This was the correct answer.

E "Models (e.g. Fitts' Law)" is correct because model-based evaluation uses predictive formulas to derive measures of user performance, so a system can be evaluated without any user being present.

Canvas review

Quiz 13 · Question 13

Back to Question

Official verified · Fully correct · Canvas 3 / 3 pts

Your selection A, E | Official key A, E

A. - Usability testing

E. - Experiments

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

A [Correct!] - Usability testing. You selected this answer. This was the correct answer.

A "Usability testing" is correct because participants are physically present: typical users perform typical tasks while being observed and timed, with data recorded on video and key presses logged.

E [Correct!] - Experiments. You selected this answer. This was the correct answer.

E "Experiments" is correct because an experiment tests a hypothesis about the relationship between variables by having participants perform under the manipulated conditions; there is no experiment without human subjects.

Canvas review

Quiz 13 · Question 14

Back to Question

Official verified · Fully correct · Canvas 3 / 3 pts

Your selection B, D | Official key B, D

B. - Heuristic evaluation followed by a think-aloud study: heuristic evaluation is cheap and can identify likely problem areas early, and think-aloud can then probe whether those problems affect real users in practice.

D. - Cognitive walkthrough followed by heuristic evaluation: cognitive walkthrough focuses on learnability by stepping through tasks from a new user's perspective, and heuristic evaluation then checks broader design principles; together they cover complementary expert-based concerns without requiring participants.

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

B [Correct!] - Heuristic evaluation followed by a think-aloud study: heuristic evaluation is cheap and can identify likely problem areas early, and think-aloud can then probe whether those problems affect real users in practice.. You selected this answer. This was the correct answer.

B "Heuristic evaluation followed by a think-aloud study" is correct because it follows the recommended order of the main steps in evaluation: carry out the non-participant methods first, then use their results to plan the participant testing. The cheap expert pass narrows down where to look before any user's time is spent.

D [Correct!] - Cognitive walkthrough followed by heuristic evaluation: cognitive walkthrough focuses on learnability by stepping through tasks from a new user's perspective, and heuristic evaluation then checks broader design principles; together they cover complementary expert-based concerns without requiring participants.. You selected this answer. This was the correct answer.

D "Cognitive walkthrough followed by heuristic evaluation" is correct because it pairs two non-participant methods that examine different things — learnability through exploration, and compliance with broad usability principles — and neither requires the users the team cannot yet recruit.

Canvas review

Quiz 13 · Question 15

Back to Question

Official verified · Fully correct · Canvas 3 / 3 pts

Your selection B, C, E | Official key B, C, E

B. - It is an expert-based review method to identify usability issues.

C. - It uses a set of established usability principles as guidelines.

E. - It is often conducted early in the design process to catch usability problems.

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

B [Correct!] - It is an expert-based review method to identify usability issues.. You selected this answer. This was the correct answer.

B "It is an expert-based review method to identify usability issues" is correct because a small set of evaluators — not users — examines the interface and judges its compliance with recognised usability principles.

C [Correct!] - It uses a set of established usability principles as guidelines.. You selected this answer. This was the correct answer.

C "It uses a set of established usability principles as guidelines" is correct because the review is guided by heuristics: Nielsen's ten, derived empirically from an analysis of 249 usability problems, or a domain-appropriate set such as WCAG for websites.

E [Correct!] - It is often conducted early in the design process to catch usability problems.. You selected this answer. This was the correct answer.

E "It is often conducted early in the design process to catch usability problems" is correct because it is a non-participant method, and the recommended evaluation sequence puts non-participant methods first so their findings can shape the later participant testing.

Canvas review

Quiz 13 · Question 16

Back to Question

Official verified · Fully correct · Canvas 3 / 3 pts

Your selection A, B, C, D | Official key A, B, C, D

A. Inspectors work independently through the interface before comparing notes.

B. The final report should prioritise suggestions that yield the largest usability improvement for the lowest cost.

C. Each inspector captures screen images or locations to provide context for identified problems.

D. The group collaborates to merge problem lists, brainstorm fixes, and prioritise recommendations.

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

A [Correct!] Inspectors work independently through the interface before comparing notes.. You selected this answer. This was the correct answer.

A "Inspectors work independently through the interface before comparing notes" is correct because during the one-to-two-hour evaluation period each expert works separately — one pass to get a feel for the product, a second to focus on specific features. Independence is what stops evaluators anchoring on each other's findings.

B [Correct!] The final report should prioritise suggestions that yield the largest usability improvement for the lowest cost.. You selected this answer. This was the correct answer.

B "The final report should prioritise suggestions that yield the largest usability improvement for the lowest cost" is correct because the output is severity-rated and has to be usable by a development team with finite resources; ranking by impact against cost is what makes the report actionable.

C [Correct!] Each inspector captures screen images or locations to provide context for identified problems.. You selected this answer. This was the correct answer.

C "Each inspector captures screen images or locations to provide context for identified problems" is correct because a problem is only actionable if the team can find it again. Without a location, the debriefing session cannot merge duplicate reports or judge severity.

D [Correct!] The group collaborates to merge problem lists, brainstorm fixes, and prioritise recommendations.. You selected this answer. This was the correct answer.

D "The group collaborates to merge problem lists, brainstorm fixes, and prioritise recommendations" is correct because this is the debriefing session, where the experts work together to prioritise the problems each of them found separately.

Canvas review

Quiz 13 · Question 17

Back to Question

Official verified · Fully correct · Canvas 3 / 3 pts

Your selection A, C, D | Official key A, C, D

A. A progress bar showing percentage completion when downloading a large file.

C. Tags selected by the user turning a distinct highlight colour to indicate they are active.

D. A shopping cart icon updating its count immediately after an item is added.

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

A [Correct!] A progress bar showing percentage completion when downloading a large file.. You selected this answer. This was the correct answer.

A "A progress bar showing percentage completion" is correct because it keeps the user informed about what the system is currently doing, through timely feedback, during an operation that would otherwise look like nothing happening.

C [Correct!] Tags selected by the user turning a distinct highlight colour to indicate they are active.. You selected this answer. This was the correct answer.

C "Tags selected by the user turning a distinct highlight colour" is correct because the highlight makes the current selection state visible rather than something the user must remember.

D [Correct!] A shopping cart icon updating its count immediately after an item is added.. You selected this answer. This was the correct answer.

D "A shopping cart icon updating its count immediately after an item is added" is correct because it reports the changed state of the system the moment the action takes effect, so the user never has to guess whether the item went in.

Canvas review

Quiz 13 · Question 18

Back to Question

Official verified · Fully correct · Canvas 3 / 3 pts

Your selection C | Official key C

C. By providing constraints that make invalid inputs impossible.

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

C [Correct!] By providing constraints that make invalid inputs impossible.. You selected this answer. This was the correct answer.

C "By providing constraints that make invalid inputs impossible" is correct because Error Prevention is about stopping the error from ever occurring. Designing the input so that an invalid value cannot be entered — a date picker instead of a free-text date field, a greyed-out button until the form is valid — removes the error condition rather than handling it.

Canvas review

Quiz 13 · Question 19

Back to Question

Official verified · Fully correct · Canvas 3 / 3 pts

Your selection C, D, E | Official key C, D, E

C. It is a usability evaluation method focused on how easily new users can learn a system.

D. It involves experts stepping through tasks from a user's perspective.

E. It is used to identify potential usability issues during early design stages.

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

C [Correct!] It is a usability evaluation method focused on how easily new users can learn a system.. You selected this answer. This was the correct answer.

C "It is a usability evaluation method focused on how easily new users can learn a system" is correct because the method's explicit focus is ease of learning: it asks whether someone encountering the interface for the first time can work it out by exploration rather than training.

D [Correct!] It involves experts stepping through tasks from a user's perspective.. You selected this answer. This was the correct answer.

D "It involves experts stepping through tasks from a user's perspective" is correct because the designer presents an aspect of the design plus usage scenarios, the expert is told the assumptions about user population, context of use and task details, and then walks through the prototype answering the walkthrough questions as the user would meet them.

E [Correct!] It is used to identify potential usability issues during early design stages.. You selected this answer. This was the correct answer.

E "It is used to identify potential usability issues during early design stages" is correct because the method is quick and inexpensive, needs only a prototype, and is explicitly recommended as a test-run before committing to usability testing in the lab.

Canvas review

Quiz 13 · Question 20

Back to Question

Official verified · Fully correct · Canvas 3 / 3 pts

Your selection B, D, E | Official key B, D, E

B. Cognitive walkthrough focuses on learnability, particularly whether new users can accomplish tasks through exploration and reasoning.

D. Cognitive walkthrough assumes users are actively problem-solving, rather than following memorised procedures.

E. Cognitive walkthrough can be conducted without real users, relying on evaluators' systematic reasoning about user cognition.

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

B [Correct!] Cognitive walkthrough focuses on learnability, particularly whether new users can accomplish tasks through exploration and reasoning.. You selected this answer. This was the correct answer.

B "Cognitive walkthrough focuses on learnability" is correct because ease of learning is the method's stated focus, and the questions quoted in the scenario are the walkthrough questions themselves — will the user realise the sub-task is needed, will the correct action be obvious, will they understand the label, will they interpret the system's response correctly.

D [Correct!] Cognitive walkthrough assumes users are actively problem-solving, rather than following memorised procedures.. You selected this answer. This was the correct answer.

D "Cognitive walkthrough assumes users are actively problem-solving" is correct because the method is built on a model of exploratory learning: the user has a goal, explores the system for useful elements, selects one to try, and interprets the response. That model only makes sense for someone working the interface out rather than executing a memorised routine.

E [Correct!] Cognitive walkthrough can be conducted without real users, relying on evaluators' systematic reasoning about user cognition.. You selected this answer. This was the correct answer.

E "Cognitive walkthrough can be conducted without real users" is correct because the evaluator draws on stated assumptions about the user population, context of use and task details, and reasons systematically about user cognition using Norman's gulfs — which is why the method is quick and cheap.

Canvas review

Quiz 13 · Question 21

Back to Question

Official verified · Fully correct · Canvas 3 / 3 pts

Your selection A, B, E | Official key A, B, E

A. The primary concern is learnability — whether new users can figure out the interface without training.

B. The team needs findings quickly and cannot yet recruit and schedule users.

E. The prototype is at an early stage where the designer is still willing to make structural changes.

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

A [Correct!] The primary concern is learnability — whether new users can figure out the interface without training.. You selected this answer. This was the correct answer.

A "The primary concern is learnability" is correct because ease of learning is the method's declared focus; no other evaluation method in this lecture targets it so directly.

B [Correct!] The team needs findings quickly and cannot yet recruit and schedule users.. You selected this answer. This was the correct answer.

B "The team needs findings quickly and cannot yet recruit and schedule users" is correct because being quick, inexpensive and doable without users is exactly what a cognitive walkthrough offers. Recruitment, scheduling and consent are the slow parts of any participant method.

E [Correct!] The prototype is at an early stage where the designer is still willing to make structural changes.. You selected this answer. This was the correct answer.

E "The prototype is at an early stage where the designer is still willing to make structural changes" is correct because the walkthrough's output is structural — it says the user will not realise this sub-task is needed, or will not connect this label to this outcome. That is only useful while the layout and flow can still be rebuilt.

Canvas review

Quiz 13 · Question 22

Back to Question

Official verified · Fully correct · Canvas 3 / 3 pts

Your selection C, D, E | Official key C, D, E

C. A/B testing requires splitting users into groups to test different versions.

D. A/B testing is a controlled experiment to measure the impact of design changes.

E. A/B testing compares two or more design variations to see which performs better.

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

C [Correct!] A/B testing requires splitting users into groups to test different versions.. You selected this answer. This was the correct answer.

C "A/B testing requires splitting users into groups to test different versions" is correct because the comparison depends on each group seeing only one version. Without the split there is no control condition and any difference could be attributed to anything.

D [Correct!] A/B testing is a controlled experiment to measure the impact of design changes.. You selected this answer. This was the correct answer.

D "A/B testing is a controlled experiment to measure the impact of design changes" is correct because it is described as a large-scale experiment: the design version is the variable being manipulated, and the measured behaviour is the outcome.

E [Correct!] A/B testing compares two or more design variations to see which performs better.. You selected this answer. This was the correct answer.

E "A/B testing compares two or more design variations to see which performs better" is correct because that is the definition given in the lecture: it compares how two groups of users perform on two versions of a design.

Canvas review

Quiz 13 · Question 23

Back to Question

Official verified · Fully correct · Canvas 3 / 3 pts

Your selection A, B, E | Official key A, B, E

A. Placing frequently used actions near where the pointer is likely to already be (e.g. near the centre of the screen after page load).

B. Placing critical actions along screen edges or in corners, where the pointer cannot overshoot the target.

E. Increasing the clickable area of small icons by adding invisible padding, even if the visual size of the icon does not change.

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

A [Correct!] Placing frequently used actions near where the pointer is likely to already be (e.g. near the centre of the screen after page load).. You selected this answer. This was the correct answer.

A "Placing frequently used actions near where the pointer is likely to already be" is correct because the other variable in the law is the distance the cursor must travel. Shortening that distance for the actions used most often is where the saving compounds.

B [Correct!] Placing critical actions along screen edges or in corners, where the pointer cannot overshoot the target.. You selected this answer. This was the correct answer.

B "Placing critical actions along screen edges or in corners" is correct because the screen boundary stops the pointer. The target behaves as though it were effectively infinite in that direction, so the user can throw the cursor at it without the careful deceleration that overshoot risk normally forces.

E [Correct!] Increasing the clickable area of small icons by adding invisible padding, even if the visual size of the icon does not change.. You selected this answer. This was the correct answer.

E "Increasing the clickable area of small icons by adding invisible padding" is correct because Fitts' Law is governed by the target's size, not its appearance. The pointer only has to land inside the hit area, so enlarging that area shortens pointing time even when the icon looks identical.

Canvas review

Quiz 13 · Question 24

Back to Question

Official verified · Fully correct · Canvas 1 / 1 pts

Your selection E | Official key E

E. Participants must voluntarily agree to participate after receiving clear information.

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

E [Correct!] Participants must voluntarily agree to participate after receiving clear information.. You selected this answer. This was the correct answer.

E "Participants must voluntarily agree to participate after receiving clear information" is correct because it names both halves of the principle. The informed half means telling the user what is being recorded — video, audio, data logging — and answering their questions without biasing them; the consent half means the agreement is freely given, which is why the ethics guidance says explicitly not to coerce users.

Quiz 15 · Question 11

Back to Question

Official verified · Fully correct · Canvas 2 / 2 pts

Your selection C, D, E | Official key C, D, E

C. A single design solution is unlikely to meet the needs of all three personas equally well, and the team should explicitly consider which persona is primary when making design trade-offs.

D. Personas derived from real user research data (such as auto-ethnography or interviews) are more grounded and useful than personas invented without data, because they reflect actual user behaviour and context rather than designer assumptions.

E. Personas are useful for cognitive walkthroughs because they give evaluators a concrete user perspective to adopt when asking "would this user know what to do next?"

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

C [Correct!] A single design solution is unlikely to meet the needs of all three personas equally well, and the team should explicitly consider which persona is primary when making design trade-offs.. You selected this answer. This was the correct answer.

D [Correct!] Personas derived from real user research data (such as auto-ethnography or interviews) are more grounded and useful than personas invented without data, because they reflect actual user behaviour and context rather than designer assumptions.. You selected this answer. This was the correct answer.

E [Correct!] Personas are useful for cognitive walkthroughs because they give evaluators a concrete user perspective to adopt when asking "would this user know what to do next?". You selected this answer. This was the correct answer.

Correct answers

- "Personas are useful for cognitive walkthroughs because they give evaluators a concrete user perspective to adopt when asking "would this user know what to do next?""
- "A single design solution is unlikely to meet the needs of all three personas equally well, and the team should explicitly consider which persona is primary when making design trade-offs."
- "Personas derived from real user research data (such as auto-ethnography or interviews) are more grounded and useful than personas invented without data, because they reflect actual user behaviour and context rather than designer assumptions."

Quiz 15 · Question 12

Back to Question

Official verified · Fully correct · Canvas 2 / 2 pts

Your selection A, C, D, E | Official key A, C, D, E

A. The mismatch between the user's mental model and the system's actual behaviour is a usability problem, because the user's expectations will lead to strategies that produce poor results.

C. Heuristic evaluation could identify this as a violation of the heuristic "Match between system and the real world," because the system uses conventions that do not match users' existing knowledge and expectations.

D. A think-aloud study would be well suited to revealing this mismatch, because users would verbalise their expectations and confusion as they interact with the search interface.

E. Affordances play a role here: if the search box looks identical to a Google search bar with no indication of required syntax, it affords natural language search and actively misleads users about the system's behaviour.

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

A [Correct!] The mismatch between the user's mental model and the system's actual behaviour is a usability problem, because the user's expectations will lead to strategies that produce poor results.. You selected this answer. This was the correct answer.

C [Correct!] Heuristic evaluation could identify this as a violation of the heuristic "Match between system and the real world," because the system uses conventions that do not match users' existing knowledge and expectations.. You selected this answer. This was the correct answer.

D [Correct!] A think-aloud study would be well suited to revealing this mismatch, because users would verbalise their expectations and confusion as they interact with the search interface.. You selected this answer. This was the correct answer.

E [Correct!] Affordances play a role here: if the search box looks identical to a Google search bar with no indication of required syntax, it affords natural language search and actively misleads users about the system's behaviour.. You selected this answer. This was the correct answer.

Correct answers

- "The mismatch between the user's mental model and the system's actual behaviour is a usability problem, because the user's expectations will lead to strategies that produce poor results."
- "A think-aloud study would be well suited to revealing this mismatch, because users would verbalise their expectations and confusion as they interact with the search interface."

Canvas feedback & option evidence

A [Correct!] Offering context-sensitive help within the interface. You selected this answer. This was the correct answer.

Canvas review

Quiz 17 · Question 10

Back to Question

Official verified · Fully correct · Canvas 1 / 1 pts

Your selection D | Official key D

D. Users should be able to recognise and use features rather than memorise them

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

D [Correct!] Users should be able to recognise and use features rather than memorise them. You selected this answer. This was the correct answer.

Canvas review

Quiz 17 · Question 11

Back to Question

Official verified · Fully correct · Canvas 1 / 1 pts

Your selection A, C | Official key A, C

A. Using patterns or textures in addition to color to differentiate elements

C. Ensuring sufficient contrast between text and background colors

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

A [Correct!] Using patterns or textures in addition to color to differentiate elements. You selected this answer. This was the correct answer.

A Correct. Someone who can't tell two hues apart can still tell two patterns apart, so the information no longer depends on colour alone.

C [Correct!] Ensuring sufficient contrast between text and background colors. You selected this answer. This was the correct answer.

C Correct. Contrast is about brightness difference rather than hue, so the text stays readable even when two colours look alike to the user.

Canvas review

Quiz 17 · Question 12

Back to Question

Official verified · Fully correct · Canvas 1 / 1 pts

Your selection B, E | Official key B, E

B. Providing text labels or icons in addition to color cues

E. Ensuring sufficient contrast between text and background colors

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

B [Correct!] Providing text labels or icons in addition to color cues. You selected this answer. This was the correct answer.

B Correct. Colour should never be the only cue. Add a label, pattern or icon alongside it so the meaning still gets through without the colour.

E [Correct!] Ensuring sufficient contrast between text and background colors. You selected this answer. This was the correct answer.

E Correct. High contrast between text and background comes first in the lecture's best-practice summary. With low contrast the text looks blurry and tires the eyes.

Canvas review

Quiz 17 · Question 13

Back to Question

Official verified · Fully correct · Canvas 1 / 1 pts

Your selection C, E | Official key C, E

C. Task B is a good user task because it states a realistic user goal without describing how to perform it.

E. Task A is problematic because it leads the user by specifying interface actions rather than stating a goal.

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

C [Correct!] Task B is a good user task because it states a realistic user goal without describing how to perform it.. You selected this answer. This was the correct answer.

C Correct. It describes a realistic goal and leaves the route up to the participant, which is what you want to observe.

E [Correct!] Task A is problematic because it leads the user by specifying interface actions rather than stating a goal.. You selected this answer. This was the correct answer.

E Correct. It tells the participant exactly where to click, so you learn nothing about whether they could have found the way themselves. A task should say what to do, not how.

Canvas review

Quiz 17 · Question 14

Back to Question

Official verified · Fully correct · Canvas 1 / 1 pts

Your selection A, B, E | Official key A, B, E

A. The sample may not be representative because experience and computer literacy are higher than in the intended user population.

B. The limited diversity of the participant group constrains the conclusions primarily to tech-savvy users, rather than the full user population.

E. Recruiting participants with strong interest and motivation may bias results toward more positive usability outcomes.

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

A [Correct!] The sample may not be representative because experience and computer literacy are higher than in the intended user population.. You selected this answer. This was the correct answer.

A Correct. This sample is more computer-literate than the typical undergraduate, so problems that ordinary students would hit may never show up.

B [Correct!] The limited diversity of the participant group constrains the conclusions primarily to tech-savvy users, rather than the full user population.. You selected this answer. This was the correct answer.

B Correct. Findings only carry over to people like the sample, here tech-savvy young students, not to all undergraduates.

E [Correct!] Recruiting participants with strong interest and motivation may bias results toward more positive usability outcomes.. You selected this answer. This was the correct answer.

E Correct. Enthusiasts who volunteer quickly tend to push through friction and rate things more positively.

Canvas review

Quiz 17 · Question 15

Back to Question

Official verified · Fully correct · Canvas 1 / 1 pts

Your selection B | Official key B

B. At least 5

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

B [Correct!] At least 5. You selected this answer. This was the correct answer.

B Correct. The rule of thumb is that about five participants are enough to find roughly 80% of the problems. In practice it is often 5–10, or until no new insights appear.

Canvas review

Quiz 17 · Question 16

Back to Question

Official verified · Fully correct · Canvas 1 / 1 pts

Your selection B, C, D | Official key B, C, D

B. Think-aloud is effective at revealing why usability problems occur, by providing insight into users' reasoning.

C. The act of thinking aloud can slow users down and alter their behaviour, affecting performance measures.

D. Think-aloud can be used early in development with a small number of users and limited resources.

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

B [Correct!] Think-aloud is effective at revealing why usability problems occur, by providing insight into users' reasoning.. You selected this answer. This was the correct answer.

B Correct. Logs and timings show where users struggled, while what they say shows the reasoning behind it.

C [Correct!] The act of thinking aloud can slow users down and alter their behaviour, affecting performance measures.. You selected this answer. This was the correct answer.

C Correct. Talking through the task is an extra load on top of doing it, so it affects the performance measures.

D [Correct!] Think-aloud can be used early in development with a small number of users and limited resources.. You selected this answer. This was the correct answer.

D Correct. You only need someone to take notes, which suits early prototypes and small participant numbers.

Canvas review

Quiz 17 · Question 17

Back to Question

Official verified · Fully correct · Canvas 1 / 1 pts

Your selection A, B, C | Official key A, B, C

A. The think-aloud setting is unnatural, as users do not normally verbalise their thoughts while performing tasks.

B. The experimenter can bias results, both deliberately (e.g. task choice) and inadvertently (e.g. facial expressions).

C. Users may filter what they say to avoid looking incompetent or to please the evaluator.

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

A [Correct!] The think-aloud setting is unnatural, as users do not normally verbalise their thoughts while performing tasks.. You selected this answer. This was the correct answer.

A Correct. Nobody narrates their thoughts while using a product normally, so the behaviour is already one step removed from real use.

B [Correct!] The experimenter can bias results, both deliberately (e.g. task choice) and inadvertently (e.g. facial expressions).. You selected this answer. This was the correct answer.

B Correct. The choice of tasks, the tone of voice and even facial expressions can nudge the participant without anyone meaning to.

C [Correct!] Users may filter what they say to avoid looking incompetent or to please the evaluator.. You selected this answer. This was the correct answer.

C Correct. Participants often want to look competent or stay polite towards the facilitator.

Canvas review

Quiz 17 · Question 18

Back to Question

Official verified · Fully correct · Canvas 1 / 1 pts

Your selection A | Official key A

A. Within-subject design, mixed-method analysis, semi-structured interview

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

A [Correct!] Within-subject design, mixed-method analysis, semi-structured interview. You selected this answer. This was the correct answer.

A Correct on all three. Every participant goes through all three conditions, which makes it within-subject. The Likert ratings are quantitative and the interviews are qualitative, so it is mixed-method. A prepared set of questions with room for follow-ups is a semi-structured interview.

Canvas review

Quiz 17 · Question 19

Back to Question

Official verified · Fully correct · Canvas 1 / 1 pts

Your selection B, C | Official key B, C

B. A usability test where the system's responses are secretly controlled by a human

C. A method used to test concepts before building full functionality

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

B [Correct!] A usability test where the system's responses are secretly controlled by a human. You selected this answer. This was the correct answer.

B Correct. A person plays the system behind the scenes, so participants react to it as if it really worked.

C [Correct!] A method used to test concepts before building full functionality. You selected this answer. This was the correct answer.

C Correct. The human stands in for features that don't exist yet, which lets you try an interaction idea before spending time implementing it.

Canvas review

Quiz 17 · Question 20

Back to Question

Official verified · Fully correct · Canvas 1 / 1 pts

Your selection A, B, C | Official key A, B, C

A. A cognitive walkthrough at this stage is appropriate because it can be performed on paper prototypes or wireframes, and it specifically assesses whether a new user could learn to complete key tasks without prior training.

B. Personas developed from auto-ethnography data are useful for cognitive walkthroughs because they provide a concrete, grounded description of the target user's goals, knowledge, and context, allowing evaluators to more realistically assess each step from the user's perspective.

C. Think-aloud with the low-fidelity prototype would help the team understand how users interpret their design choices and whether their mental model of the interface matches what the designers intended.

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

A [Correct!] A cognitive walkthrough at this stage is appropriate because it can be performed on paper prototypes or wireframes, and it specifically assesses whether a new user could learn to complete key tasks without prior training.. You selected this answer. This was the correct answer.

A Correct. It works on paper prototypes or wireframes and targets how easily a new user could learn the task, without needing real users.

B [Correct!] Personas developed from auto-ethnography data are useful for cognitive walkthroughs because they provide a concrete, grounded description of the target user's goals, knowledge, and context, allowing evaluators to more realistically assess each step from the user's perspective.. You selected this answer. This was the correct answer.

B Correct. A persona built from real research gives the evaluator a concrete user to answer the walkthrough questions as.

C [Correct!] Think-aloud with the low-fidelity prototype would help the team understand how users interpret their design choices and whether their mental model of the interface matches what the designers intended.. You selected this answer. This was the correct answer.

C Correct. Hearing how users interpret the design shows where their mental model differs from the designers', even on a rough prototype.

Quiz 19 · Question 9

Back to Question

Official verified · Fully correct · Canvas 2 / 2 pts

Your selection A, C | Official key A, C

A. Speech interfaces enable hands-free interaction

C. Speech interfaces use the conversing interaction style

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

A [Correct!] Speech interfaces enable hands-free interaction. You selected this answer. This was the correct answer.

C [Correct!] Speech interfaces use the conversing interaction style. You selected this answer. This was the correct answer.

Canvas review

Quiz 19 · Question 10

Back to Question

Official verified · Fully correct · Canvas 2 / 2 pts

Your selection A, B | Official key A, B

A. Proposal A reduces pointing time because targets at screen edges are faster to acquire, and reduces decision time by limiting the number of visible choices.

B. Proposal A addresses both motor movement time and decision time, whereas Proposal B mainly addresses motor movement time.

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

A [Correct!] Proposal A reduces pointing time because targets at screen edges are faster to acquire, and reduces decision time by limiting the number of visible choices.. You selected this answer. This was the correct answer.

B [Correct!] Proposal A addresses both motor movement time and decision time, whereas Proposal B mainly addresses motor movement time.. You selected this answer. This was the correct answer.

Proposal A improves both pointing time (via Fitts's Law, by placing larger targets along the screen edge where the pointer cannot overshoot) and decision time (via Hick's Law, by reducing the number of simultaneously visible choices). Proposal B only addresses motor movement time by increasing target size; button size does not reduce choice complexity or decision time, and Hick's Law remains relevant whenever users must choose among multiple visible options.

Canvas review

Quiz 19 · Question 11

Back to Question

Official verified · Fully correct · Canvas 3 / 3 pts

Your selection A, B, C | Official key A, B, C

A. Miller’s Law is most relevant when users must hold information in mind, not when all options remain continuously visible.

B. Chunking options into meaningful categories can allow users to manage more total information without increasing memory burden.

C. Design Y is likely to impose a lower working-memory load, because users only need to consider a small number of items at each step.

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

A [Correct!] Miller’s Law is most relevant when users must hold information in mind, not when all options remain continuously visible.. You selected this answer. This was the correct answer.

B [Correct!] Chunking options into meaningful categories can allow users to manage more total information without increasing memory burden.. You selected this answer. This was the correct answer.

C [Correct!] Design Y is likely to impose a lower working-memory load, because users only need to consider a small number of items at each step.. You selected this answer. This was the correct answer.

Organising options into meaningful categories (chunking) lowers per-step cognitive load and helps users manage more information without overloading working memory. However, Miller's Law describes working-memory capacity rather than a strict limit on how many visible items can be scanned on a screen, so a flat display of 12 visible items does not automatically violate it, nor does the law predict that experienced users will always perform worse with hierarchies.

Official verified · Fully correct · Canvas 3 / 3 pts

Your selection A, B, E | Official key A, B, E

A. Because users improve with practice, initial inefficiency does not necessarily indicate poor long-term usability.

B. The Power Law implies that evaluating usability only with first-time users can give a misleading picture of long-term performance.

E. Performance typically improves rapidly during early use, with smaller incremental gains as practice continues.

Canvas status correct · The review reveals answers option by option. The tooltips explicitly identify the official correct options.

Canvas feedback & option evidence

A [Correct!] Because users improve with practice, initial inefficiency does not necessarily indicate poor long-term usability.. You selected this answer. This was the correct answer.

B [Correct!] The Power Law implies that evaluating usability only with first-time users can give a misleading picture of long-term performance.. You selected this answer. This was the correct answer.

E [Correct!] Performance typically improves rapidly during early use, with smaller incremental gains as practice continues.. You selected this answer. This was the correct answer.

According to the Power Law of Practice, task completion time decreases rapidly during early trials and then tapers off with continued practice rather than improving at a constant linear rate or hitting a hard ceiling where zero improvement is possible. Consequently, an interface (such as a command-driven or expert-oriented interface) that feels slow initially may still offer strong long-term efficiency, and testing only with first-time users can misrepresent experienced performance.
